Advice for users

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software).

Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later documentation of AUTOSAR conformance of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

1 Introduction and functional overview

The AUTOSAR Service Discovery module offers functionality to detect and offer available services – i.e. functional entities – within the vehicle network. To do so, it makes use of the IP Multicast and so called SOME/IP-SD messages.

The Service Discovery module (Sd) is located between the AUTOSAR BSW Mode Manager module (BswM) and the AUTOSAR Socket Adaptor module (SoAd).

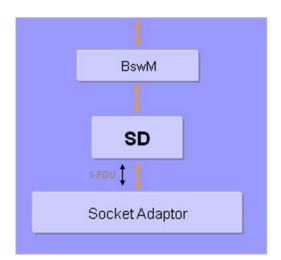

Figure 1 – Interaction of the AUTOSAR Service Discovery module

2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
BswM	Basis software manager
ECU	Electronic Control Unit
DEM	Diagnostic Event Manager
DET	Development Error Tracer
SD	Service Discovery
Sd	Service Discovery Module in AUTOSAR
SoAd	Socket Adaptor
SOME/IP	Scalable service-Oriented MiddlwarE over IP
SOME/IP-SD	SOME/IP Service Discovery

4 Constraints and assumptions

4.1 Limitations

N/A

4.2 Applicability to car domains

N/A

5 Dependencies to other modules

5.1 AUTOSAR BSW Scheduler

The BSW Scheduler calls the main functions of the Service Discovery module, which is necessary for the cyclic processes of the Service Discovery.

5.2 AUTOSAR BSW Mode Manager

The BswM module provides the link between the generic mode requests and the service requests.

5.3 AUTOSAR Socked Adaptor

The Socked Adaptor hands over service requests between the Ethernet Stack and the Service Discovery Module.

The Service Discovery module shall be able to activate and de-activate the PDU routing from and to TCP/IP-sockets and trigger the initial transport of events (triggered transmit).

The SoAds Socket Connection Table needs to be pre-configured to receive the unicast and multicast messages sent by Service Discovery modules of other ECUs. As the ECU might be connected to multiple (virtual) networks, there can exist multiple Service Discovery Instances, which may have multiple Socket Connection Table entries. The triples of Unicast Rx, Multicast Rx, and Tx PduIDs for each (virtual) interface need to be configured in the SoAd and known to the Service Discovery module.

Additionally the Service Discovery module updates endpoint information (IP address and port number) in socket connections (SoAdSocketConnection), which the Service Discovery module extracts from received Service Discovery messages.

5.4 AUTOSAR Development Error Tracer

In order to be able to report development errors, the Service Discovery module has to have access to the error hook of the Development Error Tracer.

5.5 AUTOSAR Diagnostic Event Manager

In order to be able to report production errors the Service Discovery module has to have access to the Diagnostic Event Manager.

5.6 File structure

5.6.1 Code file structure

[SWS_SD_00001][

The code file structure shall not be defined within this specification completely. At this point it shall be pointed out that the code-file structure shall include the following files named:

- Sd_Lcfg.c for link time configurable parameters and
- Sd_PBcfg.c for post build time configurable parameters.

These files shall contain all link time and post-build time configurable parameters.]()

5.6.2 Header file structure

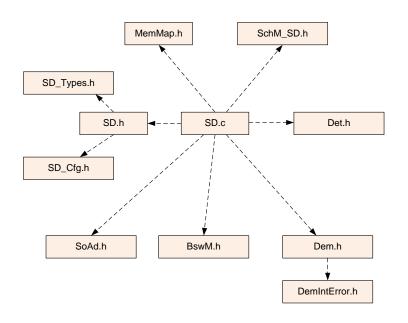

Figure 5.1: Header file structure

[SWS_SD_00003][

The module shall include the Dem.h file. By this inclusion, the APIs to report errors as well as the required Event Id symbols are included.

This specification defines the name of the Event Id symbols which are provided by XML to the DEM configuration tool. The DEM configuration tool assigns ECU dependent values to the Event Id symbols and publishes the symbols in Dem_IntErr.h.

7 Functional specification

7.1 Background & Rationale

The main tasks of the Service Discovery Module are managing the availability of functional entities called *services* in the in-vehicle communication as well as controlling the send behavior of event messages. This allows sending only event messages to receivers requiring them (Publish/Subscribe). The solution described here is also known as SOME/IP-SD (Scalable service-Oriented MiddlewarE over IP – Service Discovery).

With Service Discovery different ECUs can offer Service Instances and find available Service Instances within the vehicle network. An ECU can stop offering a Service Instances it was offering before. Later finds to such a service instance will remain unanswered. Service Instances are single implementations of a service that is defined by its service interface. In the AUTOSAR context, a find is an operation to identify available Service Instances and their locations.

In addition to the status of Service Instances, the Service Discovery is able to control sending special messages called events. These events are grouped into Eventgroups, which the Service Discovery can turn on/off in a Publish/Subscribe manner; thus, turning the sending and receiving of the events of this Eventgroup on/off.

For the remainder of this document, the following definitions apply:

- Service A functional entity that offers an interface.
- Service Instance A single instance of the Service.
- Offer A message entry that offers a Service Instances.
- Stop Offer A message that stops offering a Service Instance.
- Find A message entry used to find a Service Instance.
- Event a message send by an ECU implementing a Service Instance to an ECU using this Service Instance.
- Eventgroup A logical grouping of 1 or more events.

Figure 2 shows the interaction between Services and Eventgroups. On the abstract level, the service can contain zero to many Eventgroups. However, when creating the overall system, this information has to be configured into different ECUs with different roles (clients and servers). When instancing the Services and the contained Eventgroups, the ServerServices and ClientServices as well as the EventHandlers and ConsumedEventgroups are instantiated from the Services and Eventgroups.

A local ECU needs to deal with two different kinds of services:

- Server Services The local ECU offers Server Service Instances (i.e. located locally) to the rest of the vehicle and can be considered the server for this Service Instance.
- Client Services The local ECU may use Server Service Instances offered by another ECU inside the vehicle and can be considered a client to this Service Instance.

For Server Services the local ECUs Service Discovery module has to (server role):

- Offer the local service, when it is available; i.e. the SWC(s) offering the service are ready and the service is available in the current state of the ECU.
- Take back the offer of the local service (stop offer), when the service is no longer available.
- Answer and respond to finds by other.

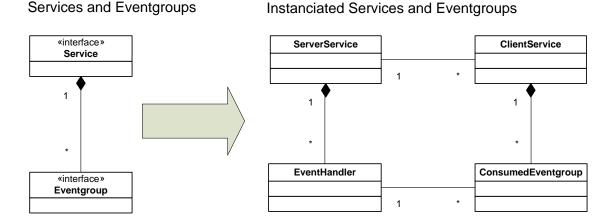

For Client Services the local ECUs Service Discovery module has to (client role):

- Listen for offers and depending of the configuration store this information in volatile memory.
- Listen for stop offers and depending of the configuration store this information in volatile memory.
- Send finds depending on the state of the current ECU and its SWCs.

Service Discovery can be used to manage Publish/Subscribe relationships as well. In the Service Discovery based Publish/Subscribe use-case one ECU (Publish/Subscribe Client with ConsumedEventgroup) is interested in receiving some data from (subscribing to) another ECU (Publish/Subscribe Server with EventHandler).

While the Subscribe is defined by an explicitly in the SD message, the Publish is based on the availability of the service Instance itself (OfferService entry). Based on the offered Service Instance the Publish/Subscribe Client may subscribe via SubscribeEventgroup entries. The Publish/Subscribe Server will now use this subscription to register the Publish/Subscribe Client as an interested party in some information specified by the subscription and start sending that information to the Publish/Subscribe Client pending some event or time-out.

As optimization, the Sd supports sending event messages to multiple clients using single multicast messages instead of a unicast message per client.

Document ID 616: SWS_ServiceDiscovery

7.2 Requirements

7.2.1 General requirements

[SWS_SD_00400][

It shall be possible to configure the Service Discovery module as an optional AUTOSAR BSW Module. Please refer to the SystemTemplate for configuration.]()

[SWS_SD_00004][

The Service Discovery shall implement a main function, which shall be called cyclically according to configuration parameter SdMainFunctionCycleTime.]()

[SWS_SD_00005][

The Service Discovery module shall store the ServiceModeRequest, which is provided via the BswM by calling the

APIs Sd_ServerServiceSetState(), Sd_ClientServiceSetState(), and Sd_ConsumedEventGroupSetState()respectively.

Sd_EventHandlerSetState() does currently not exist, since this state is directly deduced from the state of Server Service by the Service Discovery.

]()

Note:

Based on the interaction with SWCs, the following modes can be requested by the BswM module:

Server SWCs via Sd_ServerServiceSetState():

- SD_SERVER_SERVICE_DOWN
- SD SERVER SERVICE AVAILABLE

Client SWCs via Sd ClientServiceSetState():

- SD CLIENT SERVICE RELEASED
- SD CLIENT SERVICE REQUESTED

Client SWCs via Sd ConsumedEventGroupSetState()

- SD CONSUMED EVENTGROUP RELEASED
- SD CONSUMED EVENTGROUP REQUESTED

"SD_SERVER_SERVICE_DOWN" implies that the local SWC(s) offering this Service Instance are not ready to communicate,

"SD_SERVER_SERVICE_AVAILABLE" implies that the local SWC(s) offering this Service Instance are ready to communicate,

"SD_CLIENT_SERVICE_RELEASED" implies that the local SWC(s) using this Service Instance do not need to communicate with this Service Instance,

"SD_CLIENT_SERVICE_REQUESTED" implies that the local SWC(s) using this service is ready to communicate with this Service Instance and needs this Service Instance,

"SD_CONSUMED_EVENTGROUP_RELEASED" implies that the local SWC(s) using this Consumed Eventgroup do not need the events of this Consumed Eventgroup,

"SD_CONSUMED_EVENTGROUP_REQUESTED" implies that the local SWC(s) using this Consumed Eventgroup need the events of this Consumed Eventgroup.

[SWS_SD_00006][

The Service Discovery module shall indicate the states to the BswM by calling the API BswM_Sd_CurrentClientServiceState(), BswM_Sd_CurrentEventHandleState() and BswM_Sd_CurrentConsumedEventGroupState() respectively.

]()

[SWS_SD_00007][

The following CurrentStates shall be available for reporting to BswM module via BswM_Sd_ClientServiceCurrentState(), BswM_Sd_ConsumedEventGroupCurrentState(), and BswM_Sd_EventHandlerCurrentState() respectively:

- SD_CLIENT_SERVICE_DOWN

- SD_CLIENT_SERVICE_AVAILABLE
- SD CONSUMED EVENTGROUP DOWN
- SD CONSUMED EVENTGROUP AVAILABLE

- SD EVENT HANDLER RELEASED

- SD EVENT HANDLER REQUESTED

]()

Note:

"SD_CLIENT_SERVICE_DOWN" tells the local SWC(s) that this Service Instance is not available,

"SD_CLIENT_SERVICE_AVAILABLE" tells the local SWC(s) that this Service Instance is available,

"SD_CONSUMED_EVENTGROUP_DOWN" tells the local SWC(s) that this Consumed Eventgroup is not currently subscribed,

"SD_CONSUMED_EVENTGROUP_AVAILABLE" tells the local SWC(s) that this Consumed Eventgroup is currently subscribed (i.e. events are received),

"SD_EVENT_HANDLER_RELEASED" tells the local SWC(s) that no client is currently subscribed to this Eventgroup,

"SD_EVENT_HANDLER_REQUESTED" tells the local SWC(s) that at least one client is currently subscribed to this Eventgroup.

[SWS_SD_00011][

Every configured Server Service Instance shall have an ECU wide, unique SdServerServiceHandleId.

]()

[[SWS_SD_00437][

Every configured Client Service Instance shall have an ECU wide, unique SdClientServiceHandleId.

[SWS_SD_00438][

Every configured Consumed Event Group shall have an ECU wide, unique SdConsumedEventGroupHandleId.

]()

[SWS_SD_00439][

Every configured Event Handler shall have an ECU wide, unique SdEventHandlerHandleId. J()

Note for SWS_SD_00011, _00437, _00438, and _00439:

This is even valid for Instances or Eventgroups with the same Service ID and/or the same Service Instance ID.

7.2.2 Ethernet Communication

[SWS_SD_00013][

Every Service Discovery Configuration Instance (see configuration container SdInstance) shall have at least one TxPdu ID, one RxPdu ID for Unicast, and one RxPdu ID for Multicast (see configuration parameter SdInstanceTxPdu, SdInstanceUnicastRxPdu, and SdInstanceMulticastRxPdu respectively).]()

[SWS_SD_00017][

For different links, separate Service Discovery instance containers shall be configured.

]()

Note:

Links in this regards also includes different virtual links using Ethernet VLANs.

7.2.3 State Handling

[SWS_SD_00019][

The Service Discovery module shall store the status of all statically configured Service Instances and Eventgroups separately. ()

[SWS_SD_00020][

After initialization of the Service Discovery module by the call of the API <code>Sd_Init()</code>, all configured Server Service Instances shall have the state "SD_SERVER_SERVICE_DOWN", unless a Server Service Instance has <code>SdServerServiceAutoAvailable</code> set to true, then the state shall be set to "SD_SERVER_SERVICE_AVAILABLE".]()

[SWS_SD_00021][

After initialization of the Service Discovery module by calling of the API sd_Init(), all configured Client Service Instances shall have the state "SD_CLIENT_SERVICE_DOWN", unless a Client Service Instance has SdClientServiceAutoRequired set to true, then the state shall be set to "SD_CLIENT_SERVICE_REQUESTED".]()

[SWS_SD_00440][

After initialization of the Service Discovery module by calling of the API $Sd_Init()$, all configured Eventgroups shall have the state

"SD_CONSUMED_EVENTGROUP_DOWN", unless a Consumed Eventgroup has "SdConsumedEventGroupAutoRequired" set to true, then the state shall be set to "SD_CONSUMED_EVENTGROUP_REQUESTED" as soon as the associated Client Service Instance is requested.

]()

[SWS_SD_00441][

After initialization of the Service Discovery module by calling of the API sd_Init(), all configured Event Handler shall have the state "SD_EVENT_HANDLER_RELEASED", unless a Event Handler has SdEventHandlerAutoAvailable set to true, then the state shall be set to "SD_EVENT_HANDLER_AVAILABLE" as soon as at the associated Server Service Instance is up.

]()

[SWS_SD_00402][

The Service Discovery module shall store all IP address assignment states referenced by server and client Service Instances.

[SWS_SD_00442][

If Sd_ConsumedEventGroupSetState is called with SD_CONSUMED_EVENTGROUP_REQUESTED while its Client Service Instance is still

released (SD_CLIENT_SERVICE_RELEASED) E_NO_OK shall be returned.
]()

[SWS_SD_00443][

If <code>sd_ClientServiceSetState()</code> is called with <code>SD_CLIENT_SERVICE_RELEASED</code> while one or more of its Eventgroups are still requested

(SD_CONSUMED_EVENTGROUP_REQUESTED) the Service Discovery shall interpret this the same way as these Eventgroups were called with

SD_CONSUMED_EVENTGROUP_RELEASED first.

]()

7.2.4 Interaction with Socket Adaptor

[SWS_SD_00024][

The Service Discovery module shall be able to enable/disable routing groups within the SoAd module using the API SoAd_EnableRouting() and SoAd_DisableRouting() for Server- and Client Service Instances.

]()

[SWS_SD_00026][

The Service Discovery module shall be able to reference RoutingGroup(s) per Service Instance. See configuration parameters:

- SdConsumedEventGroupMulticastActivationRef
- SdConsumedEventGroupTcpActivationRef
- SdConsumedEventGroupUdpActivationRef
- SdClientServiceActivationRef (in SdConsumedMethods)
- SdEventActivationRef (in SdEventHandlerMulticast)
- SdEventActivationRef (in SdEventHandlerTcp)
- SdEventTriggeringRef (in SdEventHandlerTcp)
- SdEventActivationRef (in SdEventHandlerUdp)
- SdEventTriggeringRef (in SdEventHandlerUdp)
- SdServerServiceActivationRef (in SdProvidedMethods)

]()

[SWS_SD_00029][

The Service Discovery module shall only call <code>SoAd_IfTransmit()</code> if an IP address is assigned; i.e.: <code>Sd_LocalIpAddrAssignmentChg()</code> has been called with the current state <code>TCPIP_IPADDR_STATE_ASSIGNED</code>. ()

[SWS SD 00459][

For all SD messages sent and received via the Socket Adaptor module, the header mode shall be activated.

]()

[SWS_SD_00460][

For all SD messages sent and received via the Socket Adaptor module, the SoAdTxPduHeaderId and the SoAdRxPduHeaderId shall be set to 0xFFFF8100 respectively.

]()

Note: This ensures that the SoAd creates the first part of the SOME/IP header (32bit Message ID followed by a 32bit Length field) as needed for SOME/IP-SD. The remainder of the SD messages is created by this module (see chapter 7.3).

7.3 Message format

0 1 2 3 4 5 6 7	8 9 10 11 12 13 14 15	16 17 18 19 20 21 22 23	24 25 26 27 28 29 30 31	bit offset

Options Array													

Figure 3 – Overview of the Service Discovery message format

[SWS_SD_00037][

If not defined otherwise, all fields in the Service Discovery messages shall be in Network Byte Order (i.e. Big Endian Byte Order).

[SWS_SD_00030][

All Service Discovery messages shall follow the Service Discovery Message layout shown in Figure 3.

]()

[SWS_SD_00031][

The Service Discovery message format shall contain the following fields in the following order:

- Request ID (Client ID / Session ID) [32 Bit]
- Protocol Version [8 bit]
- Interface Version [8 Bit]

- Message Type [8 bit]
- Return Code [8 bit]
- Flags [8 bit]
- Reserved [24 bit]
- Length of Entries Array [32 bit]
- Entries Array (length in bytes defined by the "Length of Entries Array")
- Length of Options Array [32 bit]
- Option Array (length in bytes defined by the "Length of Options Array")
-]()

7.3.1 Request ID

This chapter describes the requirements related to the Request ID field. The Request ID is made up of Client ID and Session ID. While the Client ID is not used for Service Discovery, the Session ID is used to detect the reboot or restart of other Service Discovery instances in the vehicle in order to repair the local state of the Service Discovery module.

[SWS_SD_00032][

The Request ID field shall consist of a Client ID field [16 bits] and a Session ID field [16 bits].

]()

[SWS_SD_00033][

The Client ID shall be set statically to 0x0000. J()

[SWS_SD_00034][

After initialization of the Service Discovery Module, the Session ID for messages sent by the local ECU shall be 0x0001. ()

[SWS_SD_00035][

The Session ID shall be incremented and stored separately for multicast and every single unicast communication partner every time SoAd_IfTransmit() is called. ()

Note to SWS_SD_00034 and SWS_SD_00035: This means that the first SD message sent out to the multicast address has Session ID 0x0001 as well as the first SD message sent out to any unicast communication partner has the Session ID 0x0001 as well.

]()

[SWS_SD_00036][

Every time, the Session ID wraps around, the Session ID shall restart with the value 0x0001.

]()

Note to SWS_SD_00036: Wrap around means that the current value of the Session ID is the max value (0xFFFF) and the next increment would mean the counter must start again.

7.3.2 Protocol Version field

The Protocol Version field is used to describe the current version of SOME/IP.

[SWS_SD_00140][

The length of the Protocol Version field shall be 8 bits.]()

[SWS_SD_00141][

The value for the Protocol Version field shall be statically set to 0x01. J()

7.3.3 Interface Version field

The Interface Version field is used to describe the current version of the SOME/IP service; i.e. the current version of SOME/IP-SD itself.

[SWS_SD_00142][

The length of the Interface Version field shall be 8 bits.]()

[SWS_SD_00143][

The value for the Interface Version field shall be statically set to 0x01.]()

7.3.4 Message Type field

The Message Type field is used to differentiate the types of SOME/IP messages. SOME/IP-SD uses only event messages; thus, it always uses the same type.

[SWS_SD_00144][

The length of the Message Type field shall be 8 bits. ()

[SWS_SD_00145][

The value for the Message Type field shall be statically set to 0x02. J()

7.3.5 Return Code field

The Return Code is used to signal whether a request was successfully been processed. This is not applicable for SOME/IP-SD; therefore, the return code will be statically set to 0x00.

24 of 131

[SWS_SD_00146][

The length of the Return Code field shall be 8 bits.]()

[SWS_SD_00147][

The Return Code field shall be statically set to 0x00. J()

7.3.6 Flags field

With the Flags field the SOME/IP-SD header starts. It is used to signal global Service Discovery information, which includes currently the state of the last reboot as well as the capability of receiving unicast messages.

[SWS_SD_00149][

The length of the Flags field shall be 8 bits. J()

[SWS_SD_00150][

The first bit of the Flags field (highest order bit) shall be called Reboot Flag.]()

[SWS_SD_00151][

The Reboot Flag shall be set to '1' for all messages after reboot until the Session ID of the Request ID field wraps and thus starts with 0x0001 again. After that the Reboot Flag shall be set to '0'.

]()

[SWS_SD_00445][

The Service Discovery shall keep track of the last received of a communication partner Session ID value and Reboot Flag value independently for unicast and multicast. This means that the communication partners values received over multicast shall not be updated by a unicast message.

]()

[SWS_SD_00446][

A reboot of the communication partner shall be detected based on consecutive Service Discovery messages (for communication partner; unicast and multicast separated) in the following two ways:

- Reboot Flag changes from '0' to '1' or
- Session ID decreases, while Reboot Flag stays '1'.

]()

[SWS_SD_00447][

The Service Discovery may also detect reboots based on the unicast information. J()

[SWS_SD_00448][

A reboot detected with Session ID and Reboot Flag shall lead to expiration of the local state that is controlled by this communication partner. This means that the state of Services and Subscriptions shall be reset.

]()

[SWS_SD_00152][

The second bit of the Flag field (second highest order bit) shall be called Unicast Flag.

]()

[SWS_SD_00153][

The Unicast Flag of the Flag field shall be set to Unicast Flag and shall be set to '1', meaning: This ECU supports receiving Unicast messages.]()

[SWS_SD_00154][

Undefined bits within the Flag field shall be statically set to '0'. J()

7.3.7 Reserved field

This Reserved field is not currently used and left empty for further enhancements of the SOME/IP-SD protocol.

[SWS_SD_00155][

The length of the Reserved field shall be 24 bits. ()

[SWS_SD_00156][

All bits of the Reserved field shall be statically set to 0 binary. J()

7.3.8 Entries Array

When SOME/IP-SD find or offers Service Instances or handles subscriptions this is done by so called entries, which are transported in the entry array of the SOME/IP-SD message (see Figure 3).

7.3.8.1 Length of Entries Array

[SWS_SD_00157][

The length of the first field of the Entries Array shall be 32 bits.]()

[SWS_SD_00158][

The first field of the Entries Array shall carry the amount of bytes of the Entries Array 26 of 131 Document ID 616: SWS_ServiceDiscovery

(excluding this 32 bit field carrying the length information). J()

7.3.8.2 Entry Format Type 1

Two types of Entries exist: Type 1 Entries for Services and Type 2 Entries for Eventgroups.

[SWS_SD_00159][

The Type 1 Entries shall have the following layout:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	bit offset
	Type Index 1st options								Index 2nd options # of opt 1 # of opt 2																							
	Service ID										Instance ID																					
	Major Version								TTL																							
	Minor Version

[SWS_SD_00202][

The Reserved field, which follows the TTL field of the Type 2 Entry format layout, shall be statically set to 0x0000.

]()

[SWS_SD_00203][

The Eventgroup ID field of the Type 2 Entry format layout shall have a fixed size of 16 bits.

]()

[SWS_SD_00204][

The Eventgroup ID field of the Type 2 Entry format layout shall carry the ID of an Eventgroup, configured using the parameter SdConsumedEventGroupID.

[SWS_SD_00476][

Type 2 Entries (Entries for Eventgroups) shall not use "any values" as Service ID (i.e. 0xFFFF), Instance ID (i.e. 0xFFFF), Eventgroup ID (i.e. 0xFFFF), and/or Major Version (i.e. 0xFF).

7.3.9 Options Array

The Option array is the last part of the Service Discovery Message (see Figure 3). The options in the options array carry additional information.

7.3.9.1 Configuration Option

The Configuration Option transports additional attributes of entries in the Service Discovery messages. Between 0 and n configuration items can be transported using the Configuration Option. These configuration items can include for example the name of the host or the Service.

0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	16 17 18 19 20 21 22 23	24 25 26 27 28 29 30 31	bit offset
Length	Type (=0x01)	Reserved (=0x00)	the second secon
Zero-terminated Configuration String ([len]id=value[len]id=value[0])			

[SWS_SD_00205][

The option format shall contain the following fields in the following order and sizes:

- Length [16 bits]
- Type [8 bits]
- Reserved [8 bits]
- Zero-terminated Configuration String (format e.g. for two configuration items [len]id=value[len]id=value[0])

]()

[SWS_SD_00206][

The Length field shall carry the total number of bytes occupied by the configuration option, excluding the 16 bit Length field and the 8 bit type flag.

[SWS_SD_00207][

The Type field of the Configuration Option field shall be statically set to 0x01.]()

[SWS_SD_00208][

The Reserved field of the Configuration Option field shall be statically set to 0x00. ()

[SWS_SD_00292][

The Configuration String shall be constructed as follows from the SdServerCapabilityRecord and SdClientCapabilityRecord (Eventgroups shall include the Services CapabilityRecord as well):

• For every SdServerCapabilityRecordKey/ SdServerCapabilityRecordValue Or SdClientServiceCapabilityRecordKey/ SdClientServiceCapabilityRecordValue pair:

- A config_item_string is constructed of the concatenation of key, "=", and value.
- The length of this *config_item_string* is written as uint8 to the configuration string.
- The *config_item_string* is appended to the configuration string.
- Append a 0x00 uint8 at the end. This means no further *config_item_string* follows.

]()

Example for Configuration Option:

34 of 131

0 1 2 3 4 5 6 7	8 9 10 11 12 13 14 15	16 17 18 19 20 21 22 23	24 25 26 27 28 29 30 31	bit offset

=	x	[7]	d	by Lei eserve
e	f	=	1	overed (incl. R
2	3	[0]		

Figure 7 – Example for Configuration Option

[SWS_SD_00461][

SdServerCapabilityRecordValue and SdClientServiceCapabilityRecordValue are allowed to be empty. This means that after "=" the next length uint8 or "0" follows.]()

[SWS_SD_00466][

Receiving a config_item_string without an "=" sign shall be interpreted as key present without value.

]()

[SWS_SD_00467][

Multiple config_item_string with the same key in a single configuration option shall be supported.

]()

[SWS_SD_00468][

If SdInstanceHostname exists, a key "hostname" with the value set to the string of this configuration item shall be added to the Configuration Option.

[SWS_SD_00293][

Services exist, that are not identified by a unique 16 Bit Service ID but a unique value of the key otherserv. These services use the Service ID 0xFFFE and must always carry a configuration option with an otherserv record. ECUs receiving an entry with Service ID 0xFFFE shall use the configuration option and the otherserv record within in order to identify the relevant Service or Eventgroup configuration item. This means that two Service Instance with the same Service ID and Service ID may exist as long as their otherserv record is different.

The configuration option shall be built based on configuration parameters mentioned in <u>SWS_SD_00292</u>.

]()

7.3.9.2 IPv4 Endpoint Option

This chapter describes the fields and values of the IPv4 Endpoint Option, which transports IP Address, Layer 4 Protocols (e.g. UDP or TCP), and Port Number; thus, the information needed to communicate with a service.

When receiving a Service Discovery message offering a service and transporting an IPv4 Endpoint Option, ECUs receiving this message can dynamically configure the Socket Adaptor for using this service by updating a Socket Connection.

7.3.9.6 Handling missing, redundant, and conflicting Options

This section describes the error handling concerning options referenced by entries.

[SWS_SD_00661][

If an entry references an unknown option, this option shall be ignored. ()

[SWS_SD_00662][

If an entry references an redundant option (option that is not needed by this specific entry), this option shall be ignored.

[SWS_SD_00663][

If an entry references two or more options that are in conflict, this entry shall be answered negatively or ignored if that is not possible.

]()

[SWS_SD_00664][

When two different Configuration Options are referenced by an entry, the configuration sets shall be merged.

]()

[SWS_SD_00665][

If the two Configuration Options have conflicting items (same name), all items shall be handled. There shall be no attempt been made to merge duplicate items. ()

7.3.10 Entries referencing Options

This chapter describes how Entries can reference two runs of Options with zero to fifteen options each in order to reference additional information.

Note: Entries support two option runs to allow referencing the same Options by different Entries. With a single option run, sharing Endpoint Options while having different Configuration Options per Entry would not have work efficiently.

[SWS_SD_00223][

The first option run starts with the option referenced by the field *Index 1st options* and references zero to fifteen options.

[SWS_SD_00224][

The number of options referenced by the first option run is determined by the field # of opt 1.

]()

[SWS_SD_00225][

The second option run starts with the option referenced by the field *Index 2nd options* and references zero to fifteen options.

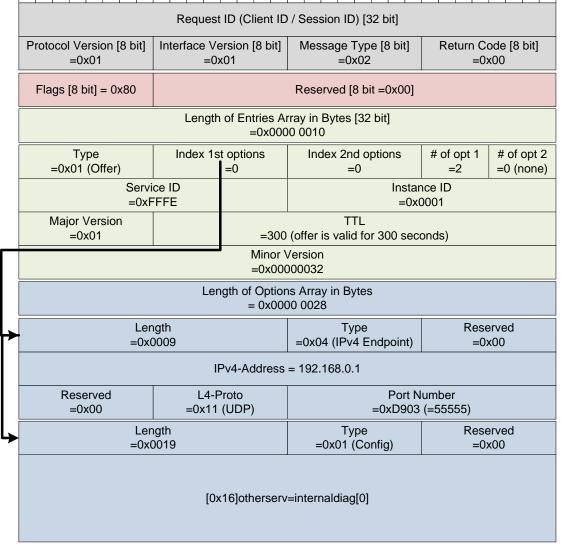

]()

[SWS_SD_00226][

The number of options referenced by the second option run is determined by the field *# of opt 2*.

]()

Note to SWS_SD_00226: Figure 12 shows an SD message example, which has an entry referencing two options in the first run:

0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 bit offset

Figure 12 – Example with Entries referencing Options

[SWS_SD_00477][

The following table shows which Option is allowed to be carried by different Entries (all other combinations shall not be used):

	Endpoint Options (IPv4 and IPv6)	Multicast Options (IPv4 and IPv6)	Configuration Option
FindService			Allowed
OfferService	Allowed		Allowed
StopOfferService	Allowed		Allowed
SubscribeEventgroup	Allowed		Allowed
StopSubscribeEventgroup	Allowed		Allowed
SubscribeEventgroupAck		Allowed	Allowed
SubscribeEventgroupNack			Allowed

Table 1 – Allowed Options per Entry

]()

Note: Usage of these Options depends on other factors that are not shown in this table. Consult the appropriate requirements in this document.

7.4 Service Discovery Entry Types

ECUs shall distribute available Service Instances and Service Instances needed as well as the Eventgroups of these Service Instances. For this purpose, they exchange entries using Service Discovery messages. This chapter describes how these entries are encoded to offer and find services as well as find and subscribe Eventgroups.

The following overview table shows to which value the Type field and the TTL field have to be set:

<u>.</u>	TTL>0		TTL=0	
Туре	0x00	0x04	0x00	0x04
0x00	FindService			
0x01	OfferService		StopOfferService	
0x02		SubscribeEventgroup		StopSubscribeEventgroup
0x03		SubscribeEventgroupAck		SubscribeEventgroupNack

Table 2 – Overview of currently supported Entry Types

7.4.1 Entries for Services (common requirements)

These requirements are valid for all Entries concerning Services including Entries of Type 0x00, 0x01, 0x02, and 0x03.

Note: Currently only Service Entries of type 0x00 and 0x01 are defined in this specification.

[SWS_SD_00294][

All entries concerning Services (FindService, OfferService, StopOfferService) shall be of Entry Format Type 1.

]()

[SWS_SD_00295][

An Instance ID of 0xFFFF shall mean any possible instances and are not allowed for OfferService and StopOfferService entries.

]()

[SWS_SD_00296][

FindService entries shall carry Service ID, Service Instance ID, Major Version, and Minor Version as configured in SdClientServiceID, SdClientServiceInstanceID, SdClientServiceMajorVersion, and SdClientServiceMinorVersion.

[SWS_SD_00297][

OfferService and StopOfferService shall carry Service ID, Service Instance ID, Major Version, Minor Version, and as configured in SdServerServiceID, SdServerServiceInstanceID, SdServerServiceMajorVersion, and SdServerServiceMinorVersion. J()

[SWS_SD_00298][

FindService entries shall carry the TTL as configured in SdClientTimerTTL. ()

[SWS_SD_00299][

OfferService entries shall carry the TTL as configured in SdServerTimerTTL. J()

[SWS_SD_00253][

A StopOfferService (type 0x01) entry shall set the TTL field to 0x000000. J()

[SWS_SD_00267][

All entries concerning Services (FindService, OfferService and StopOfferService shall carry – i.e. reference – the options as configured.

Note: see also chapter 7.3.9.6.

[SWS_SD_00281][

A StopOfferService (type 0x01), shall carry – i.e. reference – the same options as the entries trying to stop.

7.4.2 FindService entry

FindService entries allow finding Service Instances.

[SWS_SD_00240][

A FindService entry has the type field set to 0x00. ()

[SWS_SD_00444][

Service ID shall be set to the Service ID of the service that shall be found. ()

[SWS_SD_00501][

Instance ID shall be set to 0xFFFF, if all Service Instances shall be returned. It shall be set to the Instance ID of a specific Service Instance, if just a single Service Instance shall be returned.

]()

Note: This means that when receiving Instance ID 0xFFFF for all appropriate Service Instances must be answered as if separate Find Entries were received.

Example:

ECU1 offers Service 0x1234 with Instance 0xabcd. This instance is main phase. ECU2 send out find with Service ID 0x1234 and Instance ID 0xFFFF. ECU1 shall answer with Offer (Service ID 0x1234, Instance ID 0xabcd).

[SWS_SD_00502][

Major Version shall be set to 0xFF, that means that services with any version shall be returned. If set to value different than 0xFF, services with this specific major version shall be returned only.

]()

Note: It is expected that the Major Version on client side is configured to a specific value in normal operation since the client should look for an specific interface version. Different Major Versions are not compatible to each other.

[SWS_SD_00503][

Minor Version shall be set to 0xFFFF FFFF, that means that services with any version shall be returned. If set to a value different to 0xFFFF FFFF, services with this specific minor version shall be returned only.

Note: It is expected that the Minor Version on client side is configured to 0xFFFF FFFF in normal operation since the client should accept all different Minor Versions. Different Minor Versions shall be compatible to each other.

[SWS_SD_00504][

TTL shall be set according to the configuration. J()

[SWS_SD_00506][

TTL shall not be set to 0x000000 since this is considered to be the Stop entry for this entry.

]()

[SWS_SD_00652][

If TTL is set to 0xFFFFFF, the Subscribe Eventgroup entry shall be considered valid until shutdown (i.e. next reboot).

]()

[SWS_SD_00505][

FindServer entries shall never reference Endpoint or Multicast Options. They shall reference configuration options, if configured to do so.

7.4.3 OfferService entry

To offer Service Instances, the OfferService entry shall be used.

[SWS_SD_00254][

An OfferService entry shall set the type to 0x01.]()

[SWS_SD_00509][

Service ID shall be set to the Service ID of the Service Instance offered. ()

[SWS_SD_00510][

Instance ID shall be set to the Instance ID of the Service Instance offered. J()

[SWS_SD_00511][

Major Version shall be set to the Major Version of the Service Instance offered (see SdServerServiceMajorVersion).

]()

Note: Since SdServerServiceMajorVersion can be only a value up to 0xFE, the value 0xFF (any) cannot occur in an OfferService entry.

[SWS_SD_00512][

Minor Version shall be set to the Minor Version of the Service Instance offered. ()

[SWS_SD_00513][

TTL shall be set to the lifetime of the Service Instance. After this lifetime the Service Instance shall considered not been offered.

[SWS_SD_00514][

If TTL is set to 0xFFFFFF, the Offer Service entry shall be considered valid until the next reboot.

]()

[SWS_SD_00515][

TTL shall be set to another value than 0x000000 since 0x000000 is considered to be the Stop entry for this entry.

]()

[SWS_SD_00416][

Offer Service entries shall always reference at least an IPv4 or IPv6 Endpoint Option to signal how the service is reachable.

]()

[SWS_SD_00417][

For each L4 protocol needed for the service (i.e. UDP and/or TCP) an IPv4 Endpoint option shall be added if IPv4 is supported.

]()

[SWS_SD_00418][

For each L4 protocol needed for the service (i.e. UDP and/or TCP) an IPv6 Endpoint option shall be added if IPv6 is supported.

[SWS_SD_00419][

The IP addresses and port numbers of the Endpoint Options shall also be used for transporting events and notification events.

]()

[SWS_SD_00420][

In the case of UDP this information is used for the source address and the source port of the events and notification events.

[SWS_SD_00421][

In the case of TCP this is the IP address and port the client needs to open a TCP connection to in order to receive events using TCP.]()

7.4.4 Build OfferService entry

[SWS_SD_00478][

This chapter describes how to derive all necessary data to assemble an Offer Service Message:

47 of 131

- 1) Derive all static data from the configuration container. These are e.g:
 - Container SdServerService:
 - Container SdServerService:
 - Container SdServerService:
 - Container SdServerService:
 - Container SdServerTimer:
 - Container SdInstance:

SdServerServiceInstanceId

- SdServerServiceMajorVersion SdServerServiceMinorVersion
- SdServerServiceivinorvers
 - SdInstanceHostname

SdServerServiceId

- 2) If TCP is configured for this service (configuration item SdServerServiceTcpRef exists):
 - a. The generator derives a SoConID out of the SoConGroup referenced by the configuration parameter SdServerServiceTcpRef
 - b. Call the Socket Adaptor's API SoAd_GetLocalAddr() with the derived SoConID to get back the IP Address, Transport protocol (Layer 4), and the port number needed for the Endpoint Option.
 - c. Build the relevant Endpoint Option with L4-Protocol set to TCP (shall be same as in LocalAddr).
- 3) If UDP is configured for this service (configuration item
 - SdServerServiceUdpRef **exists)**:
 - a. The generator derives a SoConID out of the SoConGroup referenced by the configuration parameter SdServerServiceUdpRef
 - b. Call the Socket Adaptor's API SoAd_GetLocalAddr() with the derived SoConID to get back the IP Address, Transport protocol (Layer 4), and the port number needed for the Endpoint Option.
 - c. Build the relevant Endpoint Option with L4-Protocol set to TCP (shall be same as in LocalAddr) .
- 4) Build Configuration Option if configured (see configuration item SdServerCapabilityRecord and SdInstanceHostname).
- 5) Build Offer Service Entry as described above.

]()

7.4.5 StopOfferService entry

To stop offering Service Instances, the Stop Offer Service entry shall be used.

[SWS_SD_00422][

The Stop Offer Service entry type shall be used to stop offering Service Instances. J()

[SWS_SD_00423][

A Stop Offer Service entry shall set the type to 0x01. J()

[SWS_SD_00424][

Stop Offer Service entries shall set the entry fields exactly like the Offer Service entry they are stopping, except TTL.

[SWS_SD_00425][

TTL shall be set to 0x000000.

7.4.6 Eventgroup Entries (Common requirements)

The following requirements are valid for all Entries concerning Eventgroups including Entries of Type 0x04, 0x05, 0x06, and 0x07.

Note: Currently only Eventgroup Entry of Type 0x06 and 0x07 are defined in this specification.

[SWS_SD_00289][

Eventgroups entries include:

- SubscribeEventgroup and StopSubscribeEventgroup
- SubscribeEventgroupAck and SubscribeEventgroupNack

]()

[SWS_SD_00290][

All Eventgroup entries shall use the Entry Format Type 2. J()

[SWS_SD_00291][

Eventgroup entries shall set the Eventgroup ID to the ID of the Eventgroup and shall use 0xFFFF being any possible Eventgroup ID (configuration parameters SdConsumedEventGroupId and SdEventHandlerEventGroupId). ()

[SWS_SD_00300][

Eventgroup entries shall set the Reserved fields to 0x00 and 0x0000. J()

[SWS_SD_00301][

SubscribeEventgroup, and StopSubscribeEventgroup entries shall set the Service IDs, Service Instance IDs, and Eventgroup IDs based on the configuration (configuration parameters SdClientServiceId and SdClientServiceInstanceId).

1()

[SWS_SD_00303][

The Service Instance ID shall not be set to 0xFFFF for any "Instance". J()

[SWS_SD_00304][

SubscribeEventgroup entries shall have the TTL field set to the configured value (configuration parameter SdClientTimerTTL of SdConsumedEventGroup) and the SubscribeEventgroupAck entry shall use the TTL value of the SubscribeEventgroup entry it acknowledges. ()

[SWS_SD_xxx]

If TTL is set to 0xFFFFFF, the Subscribe Eventgroup entry shall be considered valid until the next reboot.

[SWS_SD_00306][

A StopSubscribeEventgroup (type 0x06), and SubscribeEventgroupNack (type 0x07) entry shall set the TTL field to 0x000000.

]()

[SWS_SD_00307][

Eventgroup entries shall carry the options as configured. ()

7.4.6.1 SubscribeEventgroup entry

To subscribe to Eventgroups, the SubscribeEventgroup entry shall be used.

[SWS_SD_00312][

A SubscribeEventgroup entry shall set the type to 0x06.]()

7.4.6.2 StopSubscribeEventgroup entry

To stop subscribing to an Eventgroup, the StopSubscribeEventgroup entry shall be used.

[SWS_SD_00313][

A StopSubscribeEventgroup entry shall set the type to 0x06.]()

[SWS_SD_00427][

StopSubscribeEventgroup entries shall set the entry fields exactly like the Subscribe Eventgroup entry they are stopping, except the TTL field.

[SWS_SD_00426][

The TTL shall be set to 0x000000.]()

7.4.6.3 SubscribeEventgroupAck entry

To acknowledge a SubscribeEventgroup entry, the SubscribeEventgroupAck entry shall be used and shall be used with the values as in the SubscribeEventgroup entry it stops.

[SWS_SD_00314][

A SubscribeEventgroupAck entry shall set the type to 0x07. ()

[SWS_SD_00428][

Service ID, Instance ID, Major Version, Eventgroup ID, TTL, and Reserved shall be the same value as in the Subcribe that is being answered.

[SWS_SD_00315][

A SubscribeEventgroupAck entry shall set the TTL field to the value of the SubscribeEventgroup entry, it acknowledges.

]()

[SWS_SD_00429][

Subscribe Eventgroup Ack entries referencing events and notification events that are transported via multicast shall reference an IPv4 Multicast Option and/or and IPv6 Multicast Option. The Multicast Options state to which Multicast address and port the events and notification events will be sent to.

]()

7.4.6.4 SubscribeEventgroupNack entry

[SWS_SD_00430][

The Subscribe Eventgroup Negative Acknowledgment entry type shall be used to indicate that Subscribe Eventgroup entry was NOT accepted. It shall be always sent instead of a SubscribeEventgroupAck if such an error occurred. Reasons for sending a Subscribe Eventgroup Negative Acknowledgment include:

- Combination of Service ID, Instance ID, Eventgroup ID, and Major Version is unknown
- Required TCP-connection was not opened by client
- Problems with the references options occurred (wrong values, missing endpoint, or conflicting endpoints)
- Resource problems at the Server

]()

[SWS_SD_00431][

Service ID, Instance ID, Major Version, Eventgroup ID, and Reserved shall be the same value as in the subscribe that is being answered.

[SWS_SD_00316][

A SubscribeEventgroupNack entry shall set the type to 0x07.]()

[SWS_SD_00432][

The TTL shall be set to 0x000000. J()

7.5 Sending and Receiving of Messages

This chapter describe how messages are transmitted and received using the Socket Adaptor module.

[SWS_SD_00039][

The Service Discovery module sends Service Discovery messages (Offer, StopOffer, Find,...) using the <code>SoAd_IfTransmit()</code> API carrying the referenced TxPdu (see configuration parameter <code>SdInstanceTxPdu</code>).

]()

[SWS_SD_00040][

The Service Discovery module receives Service Discovery messages via the API Sd SoAdIfRxIndication() and the configuration items

SdInstanceUnicastRxPdu and SdInstanceMulticastRxPdu. The remote address must be saved in the call context of the Sd_RxIndication.

]()

[SWS_SD_00479][

When receiving Service Discovery messages the values of all reserved fields shall be ignored.

]()

7.5.1 Sequence for message transmission

[SWS_SD_00480][

This chapter describes the interaction with the Socket Adaptor module to send Service Discovery messages:

- 1) Precondition: Service Discovery message is assembled
- 2) In case the message shall be sent via unicast:- Call the Socket Adaptor's API SoAd_SetRemoteAddr
- 3) In case the message shall be sent via multicast:- Call the API SoAd_SetRemoteAddr to set the destination
- 4) Call SoAd_IfTransmit() to send the message on the bus

Please also refer to the sequence "CLIENT/SERVER: TransmitSdMessage" shown in Chapter 9.

]()

[SWS_SD_00481][

The Service Discovery module shall minimize the amount of messages sent by combining multiple entries within one message whenever it is possible and not in conflict to the configuration.

]()

Note:

This can be achieved for example by checking the status of all Service Instances and Eventgroups cyclically and afterwards assembling the Service Discovery Messages.

[SWS_SD_00650][

Entries received with the unicast flag set to 0, shall not be answered with unicast but ignored]()

[SWS_SD_00651][

The amount of separate Service Discovery messages shall be reduced, i.e.: Combine as much information as possible into one Service Discovery message before calling the Socket Adaptor's transmit API. This means that when a entry is sent after waiting the appropriate delay (i.e. based on Request-Response-Delay) all other entries for this communication partner may be packed into the Service Discovery message as well.]()

7.5.2 Sequence for message reception

[SWS_SD_00482][

This chapter describes the interaction with the Socket Adaptor on how Service Discovery messages are received:

- 1) When the SocketAdaptor receives a Service Discovery message, the API Sd_RxIndication() is called
- 2) Using the indicated RxPduld, the associated Service Instance has to be determined
- 3) Derive the corresponding SoConId and call the API SoAd_GetRemoteAddr()
- 4) Store address and message for further processing.
- 5) The entries shall be processed exactly in the order they arrived.

Please also refer to the sequence "CLIENT/SERVER: Sd_RxIndication" shown in Chapter 9.

[SWS_SD_00483][

When receiving Service Discovery messages, the receiver shall ignore Entries of unknown type.

]()

[SWS_SD_00484][

When receiving Service Discovery messages, the receiver shall ignore Options of unknown type.

]()

[SWS_SD_00485][

When receiving Service Discovery messages, the receiver shall ignore the values of reserved fields.

]()

7.5.3 Receiving Entries

When receiving entries the relevant Service Instance or Eventgroups have to be identified, which is explained in this section.

[SWS_SD_00486][

When receiving a FindService Entry Service ID, Instance ID, Major Version, and Minor Version must match exactly to the configured values in order to identify a Service Instances and its associated Eventgroups, except if "any values" are in the Entry (i.e. 0xFFFF for Service ID, 0xFFFF for Instance ID, 0xFF for Major Version, and 0xFFFFFF for Minor Version.)

```
See configuration parameters SdServerServiceServiceId,
SdServerServiceInstanceId, SdServerServiceMajorVersion, and
SdServerServiceMinorVersion.
```

Note:

When receiving a FindService with Service ID 0x0001, Instance ID 0xFFFF, Major Version 0x02, and Minor Version 0xFFFFFF, only the Service ID and the Major Version shall be used to match the local Service Instances and its associated Eventgroups fitting to this FindService.

[SWS_SD_00487][

When receiving an OfferService or StopOfferService the Service ID, Instance ID, Major Version must match exactly to the configured values in order to identify a Service Instances and its associated Eventgroups.

```
See configuration parameters SdClientServiceServiceId,
SdClientServiceInstanceId, and SdClientServiceMajorVersion.
]()
```

[SWS_SD_00488][

54 of 131

If SdClientServiceMinorVersion is set to 0xFFFFF the Minor Version in a received OfferService or StopOfferService entry is not checked for identifying Service Instances and its associated Eventgroups.

]()

[SWS_SD_00489][

If SdClientServiceMinorVersion is set to any value except 0xFFFFF the Minor Version in a received OfferService or StopOfferService shall be checked for identifying Service Instances and its associated Eventgroups.

[SWS_SD_00490][

When receiving Eventgroup entries (i.e.SubscribeEventgroup, StopSubscribeEventgroup, SubscribeEventgroupAck, and SubscribeEventgroupNack) the Service ID, Instance ID, Eventgroup ID, and Major Version shall be exactly matched to identify the Eventgroup.]()

7.5.3.1 Receiving Entries using Multicast

When receiving Service Discovery messages using multicast, these messages may be received by multiple ECUs at once and multiple ECUs may answer to such a message in parallel. This could lead to overload situations of the ECU that sent the first message. In order to cope with this problem the Service Discovery shall allow delaying answers to multicast as described in this section.

[SWS_SD_00491][

Answers to Entries received using multicast shall be delayed based on the appropriate configuration items:

- For ServerServices and EventHandlers :
 - o SdServerTimerRequestResponseMinDelay
 - o SdServerTimerRequestResponseMaxDelay
- For ClientServices and ConsumedEventgroups:
 - o SdClientTimerRequestResponseMinDelay
 - o SdClientTimerRequestResponseMaxDelay

]()

[SWS_SD_00492][

The delay configuration parameters for delaying Entries concerned with Services shall be taken from the Timer containers referenced by the Service containers:

- SdServerService
- SdClientService

]()

[SWS_SD_00493] [

The delay configuration parameters for delaying Entries concerned with Eventgroups shall be taken from the Timer containers reference by the Eventgroup containers:

- SdConsumedEventGroup
- SdEventHandler

55 of 131

1()

ISWS SD 004941

An Entry answering an Entry received via multicast shall be delay for a random delay between the appropriate MinDelay and MaxDelay. 1()

Note: If MinDelay and MaxDelay are set to the same value, this is the value of the delay. If MinDelay and MaxDelay are set to 0, no delay shall be introduced.

[SWS_SD_00495] [

Delaying Entries answering Entries received via multicast shall no influence other timers (e.g. for handling the repetitition phase). 1()

7.6 Timings and repetitions for Server Service and Event Handlers

Especially after starting multiple ECUs, the multicast messages of the Service Discovery come with the risk of overflowing ECUs with too many messages. Therefore, the Service Discovery can be configured with a suitable message sending behavior.

For every Server Service Instance different phases are defined as shown in Figure 13:

- Down
- Available
 - Initial Wait Phase
 - Repetition Phase 0
 - Main Phase \cap

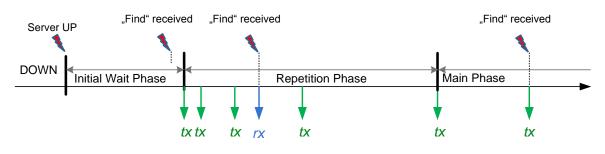

Figure 13 – Communication phases Server

[SWS SD 00605] When the Down Phase is entered (coming from states other than init), the API SoAd CloseSoCon() shall be called for all Socket Connections associated with this Server Service Instance. () 56 of 131

7.6.1 Initial Wait Phase for Server Services

This chapter describes the behavior of the Service Discovery in regard of a Server Service Instance in the Initial Wait Phase.

[SWS_SD_00317][

If the following conditions apply, the Initial Wait Phase for this configured Server Service Instance shall be entered:

- Sd_Init() has been called
- Sd_ServerServiceSetState() with SD_SERVER_SERVICE_AVAILABLE has been called
- Sd_LocalIpAddrAssignmentChg() with state "TCPIP_IPADDR_STATE_ASSIGNED" has been called for the first IpAddrId associated with the SdInstanceTxPdu.

]()

Note: Service Discovery expects that the IP address of the data/control path to be always the same. This means that a call of Sd_LocalIpAddrAssignmentChg() affects the control path and data path simultaneously.

[SWS_SD_00330][

When the Initial Wait Phase is entered, the API SoAd_EnableRouting() shall be called with SdServerServiceActivationRef of this Server Service Instance.]()

[SWS_SD_00318][

When entering the Initial Wait Phase, a random timer shall be started, using a random value within the configured range of

SdServerTimerInitialOfferDelayMin **and** SdServerTimerInitialOfferDelayMax.

[SWS_SD_00319][

If a FindService Entry is received within the Initial Wait Phase for this Server Service Instance, it shall be ignored.

]()

[SWS_SD_00320][

If a SubscribeEventgroup Entry or StopSubscribeEventgroup Entry are received within the Initial Wait Phase (or other phases) for an Event Handler of this Server Service Instance, it shall only be processed within the Service Discovery. Please refer to the according sequence diagrams and chapter 0.

[SWS_SD_00321][

When the calculated random timer based on the min and max values SdServerTimerInitialOfferDelayMin and SdServerTimerInitialOfferDelayMax expires, the first OfferService entry

shall be sent out.]()

[SWS_SD_00434][

When the calculated random timer expires and the parameter SdServerTimerInitialOfferRepetitionMax does not equals '0', the Repetition Phase shall be entered.]()

[SWS_SD_00435][

When the calculated random timer expires and the parameter

SdServerTimerInitialOfferRepetitionMax equal '0', the Main Phase shall be entered.

]()

[SWS_SD_00323][

If Sd_ServerServiceSetState() is called with a state other than SD_SERVER_SERVICE AVAILABLE while being in Initial Wait Phase, the

- Down Phase shall be entered
- all associated EventHandler shall be set to SD_EVENT_HANDLER_RELEASED and reported to BswM by calling the API

 ${\tt BswM_Sd_EventHandlerCurrentState}.$

]()

[SWS_SD_00325][

If Sd_LocalIpAddrAssignmentChg() is called with a state other than "TCPIP_IPADDR_STATE_ASSIGNED" while being in Initial Wait Phase, this phase shall be left and down shall be entered. ()

[SWS_SD_00606] When the Initial Wait Phase is entered, the API SoAd_OpenSoCon() shall be called for all Socket Connections associated with this Server Service Instance. ()

Note: As soon as an IP address is assigned again and no SD_SERVER_SERVICE_DOWN was received, the Initial Wait Phase shall be reentered with the random timer reset to the random value.

7.6.2 Repetition Phase for Server Services

This chapter describes the timing behavior of the Service Discovery in regard of Service Service Instance in the Repetition Phase.

[SWS_SD_00329][

58 of 131

```
If the Repetition Phase is entered, the Service Discovery shall wait SdServerTimerInitialOfferRepetitionBaseDelay and send an OfferService Entry. ]()
```

[SWS_SD_00336][

After the amount of cyclically sent OfferServices within the Repetitian Phase equals the amount of SdServerTimerInitialOfferRepetitionMax, the Main Phase shall be entered.

]()

Note:

Additionally sent OfferService messages which have been triggered by received FindService messages shall have no influence on the counter value of the cyclically OfferService messages.

[SWS_SD_00331][

In the Repetition Phase up to SdServerTimerInitialOfferRepetitionsMax OfferService Entries shall be sent with doubling intervals (BaseDelay, first OfferService Entries, 2x BaseDelay, second OfferService Entries, 4x BaseDelay, third OfferService Entries).

]()

Note: Example config and resulting behavior:

SdServerTimerInitialOfferRepetitionBaseDelay=30 SdServerTimerInitialOfferRepetitionMax=3

[Initial Wait Phase starts] Wait Initial Wait Delay based on Configured Min and Max Send entry. [Initial Wait Phase ends] [Repetition Phase starts] Wait 30ms (= $30ms * 2^0$). Send entry. Wait 60ms (= $30ms * 2^1$). Send entry. Wait 120ms (= $30ms * 2^2$). Send entry. [Repetition Phase ends]

[SWS_SD_00332][

If the Service Discovery Module receives a FindService Entry, the following steps shall be performed in the following order:

• Send an "Offer Service Entry" considering the appropriate delay (see chapter 7.5.3) without changing the current counter value and without influencing the current running repetition timer.

]()

Note: Currently this specification does not allow sending "Find Service Entries" using unicast. For compatibility reasons receiving such entries shall be supported.

[SWS_SD_00333][

If the Service Discovery Module receives a "SubscribeEventgroup" entry, the following steps shall be performed in the following order:

- Send a SubscribeEventgroupAck entry using Unicast considering the appropriate delay (see chapter 7.5.3) without changing the current counter value and without influencing the current running repetition timer.
- Call the BswM with the API BswM_Sd_EventHandlerCurrentState() with state SD_EVENT_HANDLER_REQUESTED only if the state for this EventHandler changed (i.e. has not been SD_EVENT_HANDLER_REQUESTED)
- Start the TTL timer according to the value received via the SubscribeEventgroup Entry.

]()

Note: Currently this specification does not allow sending "Subscribe Eventgroup Entries" using multicast. For compatibility reasons receiving such entries shall be supported.

[SWS_SD_00334][

If the Service Discovery Module receives a StopSubscribeEventgroup Entry, the following steps shall be performed in the following order:

- Stop the TTL timer for this client
- Update State
- If the this has been the last subscribed client, report "SD_EVENT_HANDLER_RELEASED" to the BswM by calling the API BswM_Sd_EventHandlerCurrentState().

]()

[SWS_SD_00458][

If the TTL of a received SubscribeEventgroup Entry expires, the following step shall be performed in the following order:

• If the this has been the last subscribed client, report "SD_EVENT_HANDLER_RELEASED" to the BswM by calling the API BswM_Sd_EventHandlerCurrentState() and update the state within the Service Discovery Module

]()

[SWS_SD_00338][

If Sd_ServerServiceSetState () is called with a state other than SD_SERVER_SERVICE_AVAILABLE (i.e. SD_SERVER_SERVICE_DOWN) while being in Repetition Phase,

- this phase shall be left and the Down Phase shall be entered and
- all associated EventHandler which state is not SD_EVENT_HANDLER_RELEASED shall be changed to SD_EVENT_HANDLER_RELEASED and indicated to the BswM by calling the API BswM Sd EventHandlerCurrentState().

[SWS_SD_00340][

If Sd_LocalIpAddrAssignmentChg() is called with a state other than
"TCPIP_IPADDR_STATE_ASSIGNED" while being in Initial Wait Phase, this phase
shall be left and the Down Phase shall be entered.
()

[SWS_SD_00341][

When the state SD_SERVER_SERVICE_DOWN is set by Sd_ServerServiceSetState() in Repetition Phase, SoAd_DisableRouting() shall be called for all IDs which are referenced by this Server Service Instance.]()

7.6.3 Main Phase for Server Services

[SWS_SD_00342][

The Service Discovery Module shall stay in the Main Phase for the configured Server Service as long as the following conditions apply:

- Server Service is in state "AVAILABLE" (i.e. Sd_ServerServiceSetState() has been called with State "SD_SERVER_SERVICE_AVAILABLE")
- IP address is assigned and can be used (i.e. Sd_LocalIpAddrAssignmentChg has been called with status TCPIP IPADDR STATE ASSIGNED)

]()

[SWS_SD_00449][

If SdServerTimerOfferCyclicDelay is greater 0, in the Main Phase an OfferService entry shall be sent cyclically with an interval defined by configuration item SdServerTimerOfferCyclicDelay.

]()

[SWS_SD_00450][

The first OfferService is sent SdServerTimerOfferCyclicDelay after the beginning of the Main Phase.

]()

[SWS_SD_00451][

If SdServerTimerOfferCyclicDelay is 0, no OfferService entries shall be sent in Main Phase for this Server Service Instance.

]()

[SWS_SD_00343][

If the Service Discovery Module receives a FindService Entry the following steps shall be performed in the following order:

• Send an "Offer Service Entry" considering the appropriate delay (see chapter 7.5.3).

Note: Currently this specification does not allow sending "Find Service Entries" using unicast. For compatibility reasons receiving such entries shall be supported.

[SWS_SD_00344][

If the Service Discovery Module receives a "SubscribeEventgroup", the following steps shall be performed in the following order:

- Send a SubscribeEventgroupAck considering the appropriate delay (see chapter 7.5.3) without influencing the current running main phase timer.
- Report to the BswM SD_EVENT_HANDLER_REQUESTED by calling the API BswM Sd EventHandlerCurrentState().
- Start the TTL timer according to the value received via the "SubscribeEventgroup".

]()

Note: Currently this specification does not allow sending "Subscribe Eventgroup Entries" using multicast. For compatibility reasons receiving such entries shall be supported.

[SWS_SD_00345][

If the Service Discovery Module receives a StopSubscribeEventgroup", the following steps shall be performed in the following order:

- Stop the TTL timer and remove it from the notification list
- If no other client is subscribed to this Eventgroup anymore, enter the State "SD_EVENT_HANDLER_RELEASED" and report it to the BswM by calling the API BswM_Sd_EventHandlerCurrentState () with state SD_SERVER_SERVICE_AVAILABLE.

]()

[SWS_SD_00347][

If the API LocalIpAddrAssignmentChg has been called with a state other than TCPIP_IPADDR_STATE_ASSIGNED,

- The Service Discovery Module shall leave the Main Phase and enter the DOWN Phase
- All EventHandler which are not in state SD_EVENT_HANDLER_RELEASED shall be set to SD_EVENT_HANDLER_RELEASED and be indicated to the BswM module by calling the API BswM_Sd_EventHandlerCurrentState

]()

[SWS_SD_00348][

If the API Server Sd_ServerServiceSetState() is called with state "SD_SERVER_SERVICE_DOWN" while the IP address is still assigned (i.e. Sd_LocalIpAddrAssignmentChg has been called with state TCPIP IPADDR STATE ASSIGNED), the Service Discovery module shall

- send a StopOfferService
- enter the DOWN Phase
- all subscriptions of the eventgroup(s) of this service instance shall be deleted and SD_EVENT_HANDLER_RELEASED and reported to BswM using the API BswM_Sd_EventHandlerCurrentState

[SWS_SD_00349][

When the Main Phase is left, the following actions shall be performed in the following order

Call the API SoAd_DisableRouting() for all IDs which are associated for this Server Service ID.

]()

[SWS_SD_00403][

When the TTL timer (contained in TTL field find or Subscribe entry) expires in state "SD_EVENT_HANDLER_REQUESTED",

```
enter the state SD_EVENT_HANDLER_RELEASED and report it to the BswM by calling
the BswM_Sd_EventHandlerCurrentState().
[()
```

7.6.4 Fan out control

This chapter describes the interaction between Service Discovery and Socket Adaptor (SoAd) in order to configure the TX path for sending out events (fan out).

[SWS_SD_00452][

The Service Discovery shall keep track of the subscribed clients per Event Handler and remove clients from the fan out, if the last SubscribeEventgroup entry was longer ago than the time specified in its TTL field of that SubscribeEventgroup entry. ()

[SWS_SD_00453][

If SdEventHandlerTCP is configured: For every SubscribeEventgroup entry of this Event Handler, the following shall be done:

- The relevant TCP Socket Connection and Routing Groups of this client shall be identified using the Address/Port of Endpoint Option (UDP) referenced in the SubscribeEventgroup entry.
- Only if this client was not subscribed before receiving this entry:
 - o SoAd EnableRouting with SdEventActivationRef
 - o SoAd IfRoutingGroupTransmit with SdEventTriggeringRef

]()

[SWS_SD_00454][

If SdEventHandlerUDP is configured: For every SubscribeEventgroup entry of this Eventhandler, the following shall be done:

The relevant UDP Socket Connection and Routing Groups of this client shall be identified using the Address/Port of Endpoint Option (UDP) referenced in the SubscribeEventgroup entry or shall be set up, if not existed before.

- Only if this client was not subscribe before receiving this entry:
 - o SoAd_EnableRouting with SdEventActivationRef depending on current number of subscribed clients and
 - SdEventHandlerMulticastThreshhold.
 - o SoAd_TriggerTransmit with SdEventTriggeringRef.

[SWS_SD_00455][

The SdEventHandlerMulticastThreshhold shall be used to control when to enable/disable Unicast/Multicast by using SoAd_EnableRouting and

SoAd_DisableRouting:

- o If SdEventHandlerMulticastThreshhold = 0: Setup Unicast to every subscribed client (Multicast always disabled).
- If SdEventHandlerMulticastThreshhold = 1: Setup Multicast if one or more clients are subscribed (Unicast always disabled).
- o If SdEventHandlerMulticastThreshhold > 1:
 - Setup Unicast for all subscribed clients if number of subscribed clients < SdEventHandlerMulticastThreshhold,
 - else setup Multicast. Switch dynamically based on the number of subscribed clients:
 - With 0 clients: nothing enabled.
 - With clients < threshold: unicast for subscribed clients enabled.
 Multicast disabled.
 - \circ With clients \geq threshold: multicast enabled. Unicast disabled.

]()

[SWS_SD_00569][

Every wildcard socket connection shall be reset to wildcard if the following conditions apply:

- Remote address of a socket connection has been set. (e.g. by SoAd or Sd)
- No subscription for this socket connection exists any more (i.e. all routing groups are disabled.)

]()

7.7 Timings and repetitions for Client Service and Consumed Eventgroups

To deskew the Service Discovery Messages on the bus, the amount of Service Discovery messaged transmitted on the bus is controlled by timing configuration.

This de-emphasis is realized by the following Phases:

- Down
- Requested
 - o Initial Wait Phase
 - Repetition Phase
 - o Main Phase

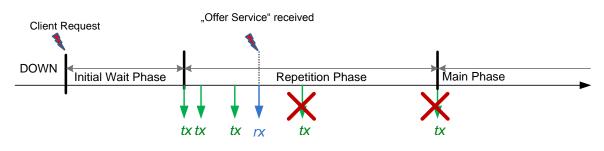

Figure 14 – Communication phases Client

7.7.1 Down Phase for Client Services

[SWS_SD_00462][

As long as a service is not requested by the BswM, the Service Discovery shall not send OfferService Entry entries.

]()

[SWS_SD_00463][

If an OfferService Entry is received during Down Phase,

- The Service Discovery shall store the state of this Service instance.
- A timer shall be set/reset to the TTL value of the received OfferService entry (TTL timer).
- Until the TTL Timer expires or a StopOfferService entry is received, the Service instance is considered Available.

]()

[SWS_SD_00464][

If Sd ClientServiceSetState() is called with state

SD CLIENT SERVICE REQUESTED while being in Down Phase:

- If no OfferService entry was received before or its TTL timer expired already:
 The Initial Wait Phase shall be entered,
- If an OfferService entry was received and its TTL timer did not expire yet:
 - Open TCP connection if SdClientServiceTcpRef is configured and was not opened before
 - The Main Phase shall be entered
 - SD_CLIENT_SERVICE_AVAILABLE shall indicated to the BswM module by calling the API
 - BswM Sd ClientServiceCurrentState()

]()

[SWS_SD_00603] When the Down Phase is entered (coming from states other than init), the API SoAd_CloseSoCon() shall be called for all Socket Connections associated with this Client Service Instance. J()

7.7.2 Initial Wait Phase for Client Services

This chapter describes the behavior of the Service Discovery in regard of a Client Service Instance in the Initial Wait Phase.

[SWS_SD_00350][

If the following conditions apply, the Initial Wait Phase for this configured Client Service Instance shall be entered:

- Sd Init() has been called.
- Sd_ClientServiceSetState() with SD_CLIENT_SERVICE_REQUESTED has been called OR SdClientServiceAutoRequired = TRUE.
- Sd_LocalIpAddrAssignmentChg() with state "TCPIP_IPADDR_STATE_ASSIGNED" has been called for the first IpAddrId associated with the SdInstanceTxPdu.

]()

[SWS_SD_00362][

When the Initial Wait Phase is entered, the API <code>SoAd_EnableRouting()</code> shall be called with <code>SdClientServiceActivationRef</code> for this Client Service Instance. J()

[SWS_SD_00604] When the Initial Wait Phase is entered, the API

SoAd_OpenSoCon() shall be called for all Socket Connections associated with this Server Service Instance. ()

[SWS_SD_00351][

This Client Service Instance shall stay in the Initial Wait Phase for a time within the configured range of SdClientTimerInitialFindDelayMin and SdClientTimerInitialFindDelayMax unless an OfferService entry for this Client Service Instance is received or this random timer expires. J()

[SWS_SD_00352][

If an OfferService Entry for this Client Service Instance is received within the Initial Wait Phase,

- The calculated random timer, which has been started when entering the Initial Wait Phase, shall be canceled.
- If received TTL is not equal to the max value, set the TTL timer for this entry to the received TTL value.
- SD_CLIENT_SERVICE_AVAILABLE shall be indicated to the BswM module by calling the API BswM Sd ClientServiceCurrentState().
- A timer shall be set to the TTL value of this entry (TTL timer).
- Open TCP connection if SdClientServiceTcpRef is configured and was not opened before
- A SubscribeEventgroup entry shall be sent out for each currently requested Consumed Eventgroup of this Client Service Instance (Consumed Eventgroups are requested using Sd_ConsumedEventGroupSetState

and with state SD_CONSUMED_EVENTGROUP_REQUESTED or automatically on startup if SdConsumedEventGroupAutoRequire is configured to true).

Leave the Initial Wait Phase Enter the Main Phase

]()

[SWS_SD_00353][

When the calculated random timer based on the parameters

SdClientTimerInitialFindDelayMin and

SdClientTimerInitialFindDelayMax expires (i.e. no OfferService has been received within this timespan), the following shall be done in the following order:

- FindService Entry shall be sent.
- o If the SdClientTimerInitialFindRepetitionsMax>0, enter the Repetition Phase
- o If the SdClientTimerInitialFindRepetitionsMax=0, enter the Main
 Phase

]()

[SWS_SD_00355][

If Sd_ClientServiceSetState() is called with state SD_CLIENT_SERVICE_RELEASED while being in Initial Wait Phase, this phase shall be left and the Service shall be "Down".

[SWS_SD_00456][

If for any reasons the Initial Wait Phase is left, the calculated random timer (of the Initial Wait Phase) for this Service Instance shall be stopped. ()

[SWS_SD_00357][

If Sd_LocalIpAddrAssignmentChg() is called with a state other than "TCPIP IPADDR STATE ASSIGNED" while being in Initial Wait Phase,

- the "Down" phase shall be entered
- the API BswM_Sd_ClientServiceCurrentState with state "SD CLIENT SERVICE DOWN" shall be called, and
- BswM_Sd_ConsumedEventGroupCurrentState with state "SD_CONSUMED_EVENTGROUP_DOWN" for all associated eventgroups of this Service Instance shall be called.

]()

[SWS_SD_00354][

If the API Sd_Init() is called while being in Initial Wait Phase,

- the "Down" phase shall be entered
- the API BswM_Sd_ClientServiceCurrentState with state "SD CLIENT_SERVICE_DOWN" shall be called, and
- BswM_Sd_ConsumedEventGroupCurrentState with state "SD_CONSUMED_EVENTGROUP_DOWN" for all associated eventgroups of this Service Instance shall be called.

]()

7.7.3 Repetition Phase for Client Services

[SWS_SD_00358][

When the Repetition Phase is entered, the Service Discovery Module shall start the timer SdClientTimerInitialFindRepetitionsBaseDelay J()

[SWS_SD_00457][

When the timer SdClientTimerInitialFindRepetitionsBaseDelay expires within the Repetition Phase, a FindOffer Message shall be sent. ()

[SWS_SD_00363][

In the Repetition Phase up to SdClientTimerInitialFindRepetitionsMax FindServer entries shall be sent with doubling intervals (BaseDelay, first FindService Entry, 2x BaseDelay, second FindService Entry, 4x BaseDelay, third FindService Entry, ...).

]()

Note: Example config and resulting behavior (no OfferService received during example):

```
SdClientTimerInitialFindRepetitionBaseDelay=30
SdClientTimerInitialFindRepetitionMax=3
```

[Initial Wait Phase starts] Wait Initial Wait Delay based on Configured Min and Max Send entry. [Initial Wait Phase ends] [Repetition Phase starts] Wait 30ms (= $30ms * 2^0$). Send entry. Wait 60ms (= $30ms * 2^1$). Send entry. Wait 120ms (= $30ms * 2^2$). Send entry. [Repetition Phase ends]

[SWS_SD_00365][

If the Service Discovery Module receives an OfferService Entry while the current state SD_CLIENT_SERVICE_REQUESTED is for this Client Service Instance, the following steps shall be performed in the following order:

- Cancel the repetition timer
- If received TTL is not equal to the max value, set the TTL timer for this entry to the received TTL value.

- If the current Sd state is SD_CLIENT_SERVICE_REQUESTED, the Sd state SD_CLIENT_SERVICE_AVAILABLE reported to BswM using the API BswM_Sd_ClientServiceCurrentState().
- Open TCP connection if SdClientServiceTcpRef is configured and was not opened before
- A SubscribeEventgroup entry shall be sent out for each currently requested Consumed Eventgroup of this Client Service Instance (Consumed Eventgroups are requested using Sd_ConsumedEventGroupSetState and with state SD_CONSUMED_EVENTGROUP_REQUESTED or automatically on startup if SdConsumedEventGroupAutoRequire is configured to true).
- Leave the Repetition Phase immediately and enter the Main Phase.

]()

[SWS_SD_00369][

After sending the maximum repetitions (defined by

SdClientTimerInitialFindRepetitionsMax) of FindService entries, the Repetition Phase shall be left and the Main Phase shall be entered. ()

[SWS_SD_00371][

If Sd_ClientServceSetState () is called with state SD_CLIENT_SERVICE_RELEASED while being in Repetition Phase, this phase shall be left, the state shall be updated. J()

[SWS_SD_00373][

If Sd_LocalIpAddrAssignmentChg() is called with a state other than "TCPIP IPADDR STATE ASSIGNED" while being in Initial Wait Phase,

- the Down phase shall entered,
- "SD_CLIENT_SERVICE_DOWN" shall indicated to the BswM module by calling the API BswM_Sd_CurrentClientServiceState(), and
- BswM_Sd_CurrentState() with state "SD_CONSUMED_EVENTGROUP_DOWN" shall be called for all associated ConsumedEventGroups.

]()

[SWS_SD_00374][

When the Down Phase is entered coming from Repetition Phase,

SoAd_DisableRouting() shall be called for all IDs which are referenced by this Server Service Instance.

]()

7.7.4 Main Phase for Client Services

[SWS_SD_00375][

The Service Discovery Module shall stay in the Main Phase as long as the following conditions apply:

• Client Service is needed (i.e. Sd_ClientServiceSetState() has been called with State "SD_CLIENT_SERVICE_REQUESTED")

• IP address assigned and can be used (i.e. Sd_LocalIpAddrAssignmentChg has been called with status TCPIP_IPADDR_STATE_ASSIGNED).

]()

[SWS_SD_00376][

If the Service Discovery Module receives an OfferService Entry, the following steps shall be performed in the following order:

- If received TTL is not equal to the max value, update the timer by the received TTL value.
- If the Sd had not reported SD_CLIENT_SERVICE_AVAILABLE since the last SD_CLIENT_SERVICE_REQUESTED, SD_CLIENT_SERVICE_AVAILABLE is reported using the API BswM Sd ClientServiceCurrentState().
- Open TCP connection if SdClientServiceTcpRef is configured and was not opened before
- For each currently requested Consumed Eventgroup of this Client Service Instance (Consumed Eventgroups are requested using Sd_ConsumedEventGroupSetState and with state SD_CONSUMED_EVENTGROUP_REQUESTED or automatically on startup if SdConsumedEventGroupAutoRequire is configured to true), the following shall be done in exactly this order:
 - A StopSubscribeEventgroup entry shall be sent out, if the last SubscribeEventgroup entry was never answered with a SubscribeEventgroupAck.
 - A SubscribeEventgroup entry shall be sent out

]()

Note: The amount of separate Service Discovery messages shall be reduced, i.e.: Combine as much information as possible into one Service Discovery message before calling the Socket Adaptor's transmit API.

[SWS_SD_00377][

If the Service Discovery Module receives a SubscribeEventgroupAck fitting this Consumed Eventgroup for the first time after this Consumed Eventgroup was requested, the following steps shall be performed in the following order:

- Use the information of the Multicast Option (if existing) to set up relevant Multicast Information in SoAd (see SoConId related to SdConsumedEventGroupMulticastActivationRef).
- Call the API SoAd_RequestIpAddrAssignment() using the IP address received by the SubscribeEventgroupAck message.
- Activate the necessary routing for UDP, TCP, and Multicast, if existing and configured.
- **Call** BswM_Sd_ConsumedEventGroupCurrentState with SD_CONSUMED_EVENTGROUP_AVAILABLE.
- Setup TTL timer with the TTL of the SubscribeEventgroupAck entry.

[SWS_SD_00465][

If the Service Discovery Module receives a SubscribeEventgroupNack for an SubscribeEventgroup entry sent, it shall do the following

- Report a DEM error and restart the TCP connection (if applicable)
- call the API SoAd_CloseSoCon() to close all socket connections associated to this service instance
- call the API SoAd_OpenSoCon() to reopen all socket connections associated to this service instance

]()

[SWS_SD_00367][

If the Service Discovery Module receives a StopOfferService Entry, the following steps shall be performed in the following order:

- Stop the TTL timers of this Client Service Instance and all related Consumed Eventgroups.
- Report this Client Service as DOWN if it was reported AVAILABLE before (call BswM_Sd_ClientServiceCurrentState with SD_CLIENT_SERVICE_DOWN and the Client Service's handle ID).
- Report all Consumed Eventgroups as DOWN that were reported AVAILABLE before (call BswM_Sd_ConsumedEventGroupCurrentState with SD_CONSUMED_EVENTGROUP_DOWN and the Consumed Eventgroup's handle ID).
- In case the entry is in state SD_CLIENT_SERVICE_AVAILABLE, it shall be changed to "SD_CLIENT_SERVICE_DOWN" and SD_CLIENT_SERVICE_DOWN shall be reported to the BswM by calling the API BswM_Sd_ClientServiceCurrentState().
- Stay in Main Phase and do not send Find ServiceEntries.

]()

[SWS_SD_00380][

The Service Discovery Module shall leave the Main Phase and enter the state SD_CLIENT_SERVICE_DOWN if at least one of the listed conditions described in <u>SWS_SD_00375</u> does not apply any more.

]()

[SWS_SD_00381][

If the Client goes DOWN which is indicated by a call of Sd_ClientServiceSetState () with State "SD_REQUEST_CLIENT_SERVICE_RELEASED" while all other conditions listed in <u>SWS_SD_00375</u> still apply, the Service Discovery module shall perform the following steps:

- Enter the Down Phase and indicate the state SD_CLIENT_SERVICE_DOWN to the BswM by calling the API BswM_Sd_ClientServiceCurrentState ().
- For all subscribed eventgroups of this Client Service,
 - a StopSubscribe shall be sent
 - the status shall be set to SD_CONSUMED_EVENTGROUP_REQUESTED and reported to

BswM by calling the API

BswM Sd ConsumedEventGroupCurrentState().

]()

[SWS_SD_00600][

If the TTL Timer of a Client Service expires, the Service Discovery module shall perform the following steps:

- Enter the Initial Wait Phase and indicate the state SD_CLIENT_SERVICE_DOWN to the BswM by calling the API BswM_Sd_ClientServiceCurrentState ().
- All subscribed Eventgroups of this Client Service shall expired in this instance (stop TTL timer) and the expiration shall be handled as describe in [SWS_SD_00601].

]()

[SWS_SD_00601][

If the TTL Timer of an Eventgroup expires, the Service Discovery module shall perform the following steps:

- the status shall be set to SD_CONSUMED_EVENTGROUP_REQUESTED and reported to BswM by calling the API BswM Sd ConsumedEventGroupCurrentState().
- send a Stop Subscribe Eventgroup entry and a Subscribe Eventgroup entry in the SOME/IP-SD message the Subscribe Eventgroup entry would have been sent with

]()

[SWS_SD_00382][

When the Main Phase is left and the Down Phase is entered, the API SoAd_DisableRouting() for all IDs which are associated for this Client Service ID.

]()

7.8 Error classification

[SWS_SD_00106][

Values for production code Event Ids are assigned externally by the configuration of the Dem. They are published in the file Dem_IntErrId.h and included via Dem.h.]()

[SWS_SD_00107][

Development error values are of type uint8.

Type or error	Relevance	Related error code	Value [hex]
SD has not been initialized	Development	SD E NOT INITIALIZED	0x01
Invalid pointer in parameter	Development	SD E INV POINTER	0x02

list			
Invalid mode request	Development	SD E INV MODE	0x03
Invalid Id	Development	SD_E_INV_ID	0x004

Table 3 – Error classification

]()

7.9 Error detection

[SWS_SD_00108][

The detection of development errors shall be configurable (*ON / OFF*) at pre-compile time. The switch *SdDevErrorDetect* (see chapter 10) shall activate or deactivate the detection of all development errors.

]()

[SWS_SD_00109][

If the *SdDevErrorDetect* switch is enabled API parameter checking is enabled. The detailed description of the detected errors can be found in chapter 7.8 and chapter 8.

]()

Note: The detection of production code errors cannot be switched off.

7.10 Error notification

[SWS_SD_00110][

Detected development errors shall be reported to the *Det_ReportError* service of the Development Error Tracer (DET) if the pre-processor switch *SdDevErrorDetect* is set (see chapter 10).

]()

[SWS_SD_00111][

Production errors shall be reported to Diagnostic Event Manager.]()

7.11 Debugging

[SWS_SD_00112][

All type definitions of variables which shall be debugged, shall be accessible by the header file Sd.h.

]()

[SWS_SD_00113][

Each variable that shall be accessible by AUTOSAR Debugging, shall be defined as global variable.

]()

[SWS_SD_00114][

The declaration of variables in the header file shall be such, that it is possible to calculate the size of the variables by C-"sizeof".]()

[SWS_SD_00115][

Variables available for debugging shall be described in the respective Basic Software Module Description.

]()

[SWS_SD_00116][

The states of Sd state machine shall be available for debugging.]()

8.2.4 Sd_ClientServiceCurrentStateType

[SWS_SD_00551][

<u></u>	<u>- 1</u>	
Name:	Sd_ClientServiceCurrentStateType	
Туре:	Enumeration	
Range:	SD_CLIENT_SERVICE_DOWN 0	
	SD_CLIENT_SERVICE_AVAILABLE 1	
Description:	This type defines the modes to indicate the current mode request of a Client Service.	

]()

8.2.5 Sd_ConsumedEventGroupCurrentStateType

[SWS_SD_00552][

Name:	Sd_ConsumedEventGroupCurrentStateType	
Туре:	Enumeration	
Range:	SD_CONSUMED_EVENTGROUP_DOWN 0	
	SD_CONSUMED_EVENTGROUP_AVAILABLE 1	
Description:	This type defines the subscription policy by consumed EventGroup for the Client Service.	

]()

8.2.6 Sd_EventHandlerCurrentStateType

[SWS_SD_00553][

<u> </u>		
Name:	Sd_EventHandlerCurrentStateType	
Туре:	Enumeration	
Range:	SD_EVENT_HANDLER_RELEASED 0	
	SD_EVENT_HANDLER_REQUESTED1	
Description:	This type defines the subscription policy by EventHandler for the Server Service.	
()		
111		

8.3 Function definitions

This is a list of functions provided for upper layer modules.

8.3.1 Sd_Init

ISWS SD 001191

Service name:	Sd_Init		
Syntax:	void Sd_Init(
	const Sd_ConfigType* ConfigPtr		
Service ID[hex]:	0x01		
Sync/Async:	Synchronous		
Reentrancy:	Non Reentrant		
Parameters (in):	ConfigPtr Pointer to a selected configuration structure.		
Parameters	None		
(inout):			
Parameters (out):	None		
Return value:	None		
Description:	Initializes the Service Discovery.		
()			

[SWS SD 00120]

The Sd Init function shall initialize the state machines for all Service Instances and set them into the state SD SERVER SERVICE DOWN and SD CLIENT SERVICE DOWN respectively.]()

[SWS_SD_00121][

The Sd Init function shall internally store the configuration data address to enable subsequent API calls to access the configuration data.]()

[SWS_SD_00122][

The Sd Init function shall remember internally the successful initialization for other API functions to check for proper module initialization.

]()

8.3.2 Sd_GetVersionInfo

[SWS_SD_00124][

00124	<u> </u>		
Service name:	Sd_GetVersionInfo		
Syntax:	void Sd_GetVersionInfo(Std_VersionInfoType* versioninfo)		
Service ID[hex]:	0x02		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters (inout):	None		
Parameters (out):	versioninfo Pointer to where to store the version information of this module.		
Return value:	None		
Description:	Returns the version information of this module.		

[SWS_Sd_00125][

The Sd_GetVersionInfo function shall return the version information of this module. The version information includes:

- Module Id
- Vendor Id
- Vendor specific version numbers

]()

[SWS_SD_00126][

Configuration of Sd_GetVersionInfo: This function shall be pre compile time configurable On/Off by the configuration parameter: SdVersionInfoApi]()

[SWS_SD_00497][

If development error detection for the Service Discovery module is enabled, then the function Sd_GetVersionInfo shall check whether the parameter VersioninfoPtr is a NULL pointer (NULL_PTR). If VersioninfoPtr is a NULL pointer, then the function Sd_GetVersionInfo shall raise the development error SD_E_INV_POINTER and return. (BSW00411)

8.3.3 Sd_ServerServiceSetState

[SWS_SD_00496][

Service name:	Sd_ServerServiceSetState
Syntax:	<pre>Std_ReturnType Sd_ServerServiceSetState(</pre>
	<pre>Sd_ServerServiceSetStateType ServerServiceState</pre>

)		
Service ID[hex]:	0x07		
Sync/Async:	Asynchronous		
Reentrancy:	Reentrant		
Parameters (in):	SdServerServiceHandleId	ID to identify the Server Service Instance.	
	ServerServiceState	The state the Server Service Instance shall be set to.	
Parameters (inout):	None		
Parameters (out):	None		
Return value:	Std_ReturnType	E_OK: State accepted E_NOT_OK: State not accepted	
Description:	This API function is used by the BswM to set the Server Service Instance state.		
()			

[SWS_SD_00407][

If development error detection is enabled and the Service Discovery module has not been initialized using Sd_Init(), the Sd_ServerServiceSetState function shall raise the development error code SD_E_NOT_INITIALIZED and the Sd_ServerServiceSetState function shall return E_NOT_OK.]()

[SWS_SD_00408][

If the parameter ServerServiceState has an undefined value, the Service Discovery module shall not store the requested mode and return E_NOT_OK. In case development error detection is enabled, the Service Discovery module shall additionally raise the development error code SD_E_INV_MODE.]()

[SWS_SD_00607] If the parameter SdServerServiceHandleld has an invalid value, the Service Discovery Module shall not store the requested mode and return E_NOT_OK. In case development error detection is enabled, the Service Discovery module shall additionally raise the development error code SD E INV ID.] ()

8.3.4 Sd_ClientServiceSetState

<u>[3₩3_3D_0040</u> 8	<u>ין י</u>		
Service name:	Sd_ClientServiceSetState		
Syntax:	<pre></pre>		
Service ID[hex]:	0x08		
Sync/Async:	Asynchronous		
Reentrancy:	Reentrant		
	ClientServiceInstanceID ID to identify the Client Service Instance.		
Parameters (in):	ClientServiceState The state the Client Service Instance shall be set to.		
Parameters (inout):	None		
Parameters (out):	None		

[SWS_SD_00409][

	Return value:		E_OK: State accepted E_NOT_OK: State not accepted
	Description:	This API function is used	by the BswM to set the Client Service Instance state.
i	()		

10

[SWS SD 00410]

If development error detection is enabled and the Service Discovery module has not been initialized using Sd Init(), the Sd ClientServiceSetState function shall raise the development error code SD E NOT INITIALIZED and the Sd ClientServiceSetState function shall return E NOT OK. 1()

[SWS SD 00411][

If the parameter ClientServiceState has an undefined value, the Service Discovery module shall not store the requested mode and return E NOT OK. In case development error detection is enabled, the Service Discovery module shall additionally raise the development error code SD E INV MODE. 1()

[SWS_SD_00608] If the parameter ClientServiceInstanceId has an invalid value, the Service Discovery module shall not store the requested mode and return E NOT OK. In case development error detection is enabled, the Service Discovery module shall additionally raise the development error code SD E INV ID. $||_{()}$

8.3.5 Sd_ConsumedEventGroupSetState

Service name:	Sd_ConsumedEventGroupSetState		
Syntax:	Std ReturnType Sd Consumed	EventGroupSetState(
•	uint16 SdConsumedEvent	GroupHandleId,	
	Sd ConsumedEventGroupSe	etStateType	
	ConsumedEventGroupState		
)		
Service ID[hex]:	0x09		
Sync/Async:	Asynchronous		
Reentrancy:	Reentrant		
	SdConsumedEventGroupHandleId	ID to identify the	
Parameters (in):		ConsumedEventGroupHandleId	
	ConsumedEventGroupState	The state the EventGroup shall be set to	
Parameters	None		
(inout):			
Parameters (out):	None		
Deturn value	Std_ReturnType	E_OK: State accepted	
Return value:		E_NOT_OK: State not accepted	
Description:	This API function is used by the Bsv	vM to set the requested state of the	
•	EventGroupStatus.	•	

]()

[SWS SD 00469][

If development error detection is enabled and the Service Discovery module has not been initialized using Sd_Init(), the Sd_ConsumedEventGroupSetState function shall raise the development error code SD_E_NOT_INITIALIZED and the Sd_ConsumedEventGroupSetState function shall return E_NOT_OK.

[SWS_SD_00470][

If <code>ConsumedEventGroupSetState</code> has an undefined value, the Service Discovery module shall not store the requested mode and return <code>E_NOT_OK</code>. In case development error detection is enabled, the Service Discovery module shall additionally raise the development error code <code>SD_E_INV_MODE</code>. J()

[SWS_SD_00609] [If the parameter SdConsumedEventGroupHandleId has an invalid value, the Service Discovery module shall not store the requested mode and return E_NOT_OK. In case development error detection is enabled, the Service Discovery module shall additionally raise the development error code

SD_E_INV_ID.] ()

8.3.6 Sd_LocallpAddrAssignmentChg

<u>5W5_5D_0041</u> 2	-]	
Service name:	Sd_LocallpAddrAssignmentChg	
Syntax:	<pre>void Sd_LocalIpAddrAssignmentChg(SoAd_SoConIdType SoConId, TcpIp_IpAddrStateType State)</pre>	
Service ID[hex]:	0x05	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant for different SoConIds. Non Reentrant for the same SoConId.	
Parameters (in): SoConId socket connection index specifying the socket connection address assigment has changed.		socket connection index specifying the socket connection where the IP address assigment has changed.
	State	state of IP address assignment.
Parameters (inout):	None	
Parameters (out):	None	
Return value:	None	
Description:	This function gets called by the SoAd if an IP address assignment related to a socket connection changes (i.e. new address assigned or assigned address becomes invalid).	

[SWS_SD_00412][

]()

[SWS_SD_00471][

If development error detection is enabled and the Service Discovery module has not been initialized using Sd_Init(), the Sd_LocalIpAddrAssignmentChg function shall raise the development error code SD_E_NOT_INITIALIZED and the Sd_LocalIpAddrAssignmentChg function shall return E_NOT_OK.]()

[SWS_SD_00472][

If the parameter State has an undefined value, the Service Discovery module shall not store the requested mode and return E_NOT_OK.

In case development error detection is enabled, the Service Discovery module shall additionally raise the development error code SD_E_INV_MODE.

additionally raise the development error code SD E INV ID. ()

8.4 Call-back notifications

This is a list of functions provided for other modules. The function prototypes of the callback functions shall be provided in the file $sd_{Cbk.h}$

8.4.1 Sd_RxIndication

[SWS_	SD	001	291 Г

Service name:	Sd_RxIndication	
Syntax:	void Sd_RxIndication(
	PduIdType RxPduId,	
	const PduInfoType* PduInfoPtr	
)	
Service ID[hex]:	0x42	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
	RxPduld ID of the received I-PDU.	
Parameters (in):	PduInfoPtr Contains the length (SduLength) of the received I-PDU and a pointer to a buffer (SduDataPtr) containing the I-PDU.	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	None	
Description:	Indication of a received I-PDU from a lower layer communication interface module.	

」()

[SWS_SD_00473][

If development error detection is enabled and the Service Discovery module has not been initialized using Sd_Init(), the Sd_RxIndication function shall raise the development error code SD_E_NOT_INITIALIZED and the Sd_RxIndication function shall return E_NOT_OK.

]()

[SWS_SD_00474][

If RxPduId has an undefined value, the Service Discovery module shall discard the message and return E NOT OK.

In case development error detection is enabled, the Service Discovery module shall additionally raise the development error code SD_E_INV_ID.

[SWS_SD_00475][

If development error detection is enabled: the function shall check parameter PduInfoPtr for being a null pointer. In this case, the function shall raise the development error SD_E_INV_POINTER and return E_NOT_OK.]()

8.5 Scheduled functions

The following functions are called directly by Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non-reentrant.

8.5.1 Sd_MainFunction

[SWS_SD_00130] [
Service name:	Sd_MainFunction	
Syntax:	void Sd_MainFunction(void)	
Service ID[hex]:	ice ID[hex]: 0x06	
Description:		
]()		

[SWS_SD_00131][

The Sd_MainFunction shall update all counters, timers, states and phases and prozess the Rx and Tx data path.

]()

[SWS_SD_00132][

If the Sd module has not been initialized using Sd_Init, the Sd_MainFunction function shall return immediately without performing any functionality and without raising any errors.

]()

8.6 Expected Interfaces

In this chapter, all interfaces required from other modules are listed.

8.6.1 Mandatory Interfaces

This chapter defines all interfaces, which are required to fulfill the core functionality of the module.

[SWS	SD	_00133]	Γ
L			

API function	Description
BswM_Sd_CurrentState	Function called by Sd to indicate current state of Sd.
Dem_ReportErrorStatus	Queues the reported events from the BSW modules (API is only used by BSW modules). The interface has an asynchronous behavior, because the processing of the event is done within the Dem main function. OBD Events Suppression shall be ignored for this computation.
SoAd_GetLocalAddr	Retrieves the local address (IP address and port) actually used for the SoAd socket connection specified by SoConId, the netmask and default router
SoAd_GetPhysAddr	Retrieves the physical source address of the Ethlf controller used by the SoAd socket connection specified by SoConId.
SoAd_GetRemoteAddr	Retrieves the remote address (IP address and port) actually used for the SoAd socket connection specified by SoConId
SoAd_IfTransmit	This service initiates a request for transmission of the L-PDU specified by the SoAdSrcPduId. The corresponding socket has to be resolved by the SoAdSrcPduId.
	This call is used to mimic the call to an IF in AUTOSAR.
	Development errors: Invalid values of SoAdSrcPduld or SoAdSrcPduInfoPtr will be reported to the development error tracer (SOAD_E_INVALID_TXPDUID or SOAD_E_PARAM_POINTER).
SoAd_SetRemoteAddr	By this API service the remote address (IP address and port) of the specified socket connection shall be set.

]()

8.6.2 Optional Interfaces

This chapter defines all interfaces, which are required to fulfill an optional functionality of the module.

[SWS_Sd	_00134][
---------	----------

API function	Description
	Function called by Service Discovery to indicate current state of the Client Service (available/down).
	Function called by Service Discovery to indicate current status of the Consumed Eventgroup (available/down).
	Function called by Service Discovery to indicate current status of the EventHandler (requested/released).
Det_ReportError	Service to report development errors.
SoAd_CloseSoCon	This service closes the socket connection specified by SoConId.
SoAd_DisableRouting	Disables routing of a group of PDUs in the SoAd related to the RoutingGroup specified by parameter id. Routing of PDUs can be either forwarding of PDUs

	from the upper layer to a TCP or UDP socket of the TCP/IP stack specified by a PduRoute or the other way around specified by a SocketRoute.
SoAd_EnableRouting	Enables routing of a group of PDUs in the SoAd related to the RoutingGroup specified by parameter id. Routing of PDUs can be either forwarding of PDUs from the upper layer to a TCP or UDP socket of the TCP/IP stack specified by a PduRoute or the other way around specified by a SocketRoute.
SoAd_GetSoConId	Returns socket connection index related to specified transmit Pduld. In case a fan-out is configured for TxPduld (i.e. multiple SoAdPduRouteDest specified) E_NOT_OK shall be returned.
SoAd_IfRoutingGroupTransmit	Triggers the transmission of all If-TxPDUs identified by the parameter id after requesting the data from the related upper layer.
SoAd_OpenSoCon	This service opens the socket connection specified by SoConId.
SoAd_ReleaselpAddrAssignment	By this API service the local IP address assignment used for the socket connection specified by SoConId is released.
SoAd_RequestIpAddrAssignment	By this API service the local IP address assignment which shall be used for the socket connection specified by SoConId is initiated.
SoAd_SetUniqueRemoteAddr	This API service shall either return the socket connection index of the SoAdSocketConnectionGroup where the specified remote address (IP address and port) is set or assign the remote address to an unused socket connection from the same SoAdSocketConnectionGroup.

10 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 8.

[SWS_SD_00135][

The Service Discovery module shall support tool based configuration. J()

[SWS_SD_00136][

The configuration tool shall check the consistency of the configuration parameters at system configuration time.

]()

10.1 Variants

10.1.1 VARIANT-PRE-COMPILE (Pre-compile Configuration)

[SWS_SD_00137][

In the variant VARIANT-PRE-COMPILE all parameters below that are marked as pre-compile configurable with "VARIANT-PRE-COMPILE" shall be configurable in a pre-compile manner, for example as #defines.

The module is most likely to be as source code delivered. J()

10.1.2 VARIANT-LINK-TIME (Link-time Configuration)

[SWS_SD_00138][

The variant VARIANT-LINK-TIME shall include all configuration options of the variant VARIANT-PRE-COMPILE. Additionally all parameters that are marked as link-time configurable with "VARIANT-LINK-TIME" shall be configurable at link time for example by linking a special configured parameter object file.

The module is most likely to be as source code delivered. J()

10.1.3 VARIANT-POST-BUILD (Post-build Configuration)

[SWS_SD_00139][

The variant VARIANT-POST-BUILD shall include all configuration options of the variant VARIANT-LINK-TIME. Additionally all parameters that are marked as post-build configurable with "VARIANT-POST-BUILD" shall be configurable post build for example by flashing configuration data.

The module is most likely to be as source code delivered.

Included Containers		
Container Name	Multiplicity	Scope / Dependency
SdEventHandlerMulticast	01	The subcontainer including the Routing Group for Activation of Events sent over Multicast. The activation ref is also being used for identification of the related Socket Connection in order to find the Multicast Address used in the Multicast Option referenced by the Subscribe EventGroup Ack entry.
SdEventHandlerTcp	0*	The subcontainer including the Routing Groups for Activation and Trigger Transmit for Events sent over TCP. The activation ref (or triggering ref if no activation ref exists) is also being used for identification of the related socket

		connections in order to find the related client by iterating the SdEventHandlerTcp elements (remote address statically configured or automatically set by opening TCP connection before subscription).
SdEventHandlerUdp	0*	The subcontainer including the Routing Groups for Activation and Trigger Transmit for Events sent over UDP. The activation ref (or triggering ref if no activation ref exists) is also being used for identification of the related socket connections in order to set the remote address of the client or find the related client by iterating the SdEventHandlerUdp elements (remote address statically configured or automatically set by method call before subscription).
SdServerCapabilityRecord	0*	Sd uses capability records to store arbitrary name/value pairs conveying additional information about the named service. The following use cases are supported: 1) Key present, with no value (e.g. "passreq" password required for this service) 2) Key present, with empty value (e.g. "PlugIns=" server supports plugins, but none are presently installed) 3) Key present, with non-empty value (e.g. "PlugIns=JPEG,MPEG2,MPEG4")

10.1.19 SdEventHandlerMulticast

SWS Item	ECUC_SD_00094 :
Container Name	SdEventHandlerMulticast
Description	The subcontainer including the Routing Group for Activation of Events sent over Multicast. The activation ref is also being used for identification of the related Socket Connection in order to find the Multicast Address used in the Multicast Option referenced by the Subscribe EventGroup Ack entry.

Configuration Parameters

SWS Item	ECUC_SD_00096 :				
Name	SdEventActivationRef				
Description	Reference to a SoAdRoutingGroup for activation of the data path for a subscribed client (start sending events after subscribe).				
Multiplicity	01				
Туре	Symbolic name reference to [SoAdRoutingGroup]				
ConfigurationClass	Pre-compile time	Pre-compile time X VARIANT-PRE-COMPILE			
-	Link time X VARIANT-LINK-TIME Post-build time X VARIANT-POST-BUILD				
Scope / Dependency	scope: local				

No Included Containers

10.1.20 SdEventHandlerTcp

SWS Item	ECUC_SD_00093 :
Container Name	SdEventHandlerTcp
Description	The subcontainer including the Routing Groups for Activation and Trigger Transmit for Events sent over TCP. The activation ref (or triggering ref if no activation ref exists) is also being used for identification of the related socket connections in order to find the related client by iterating the SdEventHandlerTcp elements (remote address statically configured or automatically set by opening TCP connection before subscription).
Configuration Parame	ters

SWS Item ECUC_SD_00096 : Name SdEventActivationRef Description Reference to a SoAdRoutingGroup for activation of the data path for a subscribed client (start sending events after subscribe). Multiplicity 0..1 Symbolic name reference to [SoAdRoutingGroup] Туре ConfigurationClass Pre-compile time Х VARIANT-PRE-COMPILE Х Link time VARIANT-LINK-TIME Х VARIANT-POST-BUILD Post-build time Scope / Dependency scope: local

SWS Item	ECUC_SD_00095 :
Name	SdEventTriggeringRef
Description	Reference to a SoAdRoutingGroup that is used for triggered transmit.
	Triggering is needed to sent out initial events on the server side after a

	client got subscribed.			
Multiplicity	01			
Туре	Symbolic name reference to [SoAdRoutingGroup]			
ConfigurationClass	Pre-compile time X VARIANT-PRE-COMPILE			
	Link time X VARIANT-LINK-TIME			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: local			

10.1.21 SdEventHandlerUdp

SWS Item	ECUC_SD_00092 :
Container Name	SdEventHandlerUdp
Description	The subcontainer including the Routing Groups for Activation and Trigger Transmit for Events sent over UDP. The activation ref (or triggering ref if no activation ref exists) is also being used for identification of the related socket connections in order to set the remote address of the client or find the related client by iterating the SdEventHandlerUdp elements (remote address statically configured or automatically set by method call before subscription).
Configuration Parameters	

ECUC_SD_00096 : SWS Item Name SdEventActivationRef Description Reference to a SoAdRoutingGroup for activation of the data path for a subscribed client (start sending events after subscribe). Multiplicity 0..1 Symbolic name reference to [SoAdRoutingGroup] Туре ConfigurationClass Pre-compile time Х VARIANT-PRE-COMPILE Link time Х VARIANT-LINK-TIME Х VARIANT-POST-BUILD Post-build time scope: local Scope / Dependency

SWS Item	ECUC_SD_00095 :			
Name	SdEventTriggeringRef			
Description	Reference to a SoAdRoutingGroup that is used for triggered transmit. Triggering is needed to sent out initial events on the server side after a client got subscribed.			
Multiplicity	01			
Туре	Symbolic name reference	to [So/	AdRoutingGroup]	
ConfigurationClass	Pre-compile time	X	VARIANT-PRE-COMPILE	
	Link time	VARIANT-LINK-TIME		
	Post-build time	Х	VARIANT-POST-BUILD	
Scope / Dependency	scope: local	-	•	

No Included Containers

10.1.22 SdProvidedMethods

SWS Item	ECUC_SD_00087 :
Container Name	SdProvidedMethods
Description	Container element for representing the needed elements of the data path for the methods provided by the service.
Configuration Parameters	

SWS Item	ECUC_SD_00090 :			
Name	SdServerServiceActivationRef			
Description	Reference to a SoAdRoutingGroup to activated and deactivate the data path for methods of the service.			
Multiplicity	01			
Туре	Symbolic name reference	e to [So/	AdRoutingGroup]	
ConfigurationClass	Pre-compile time	Pre-compile time X VARIANT-PRE-COMPILE		
	Link time X VARIANT-LINK-TIME			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: ECU			

SWS Item	ECUC_SD_00088 :			
Name	SdServerServiceTcpRef			
Description	Reference to SoAdSocketConnectionGroup used for methods. This is used to access the local IP address and port for building the endpoint option for offers of this service.			
Multiplicity	01			
Туре	Reference to [SoAdSock	etConne	ectionGroup]	
ConfigurationClass	Pre-compile time	Х	VARIANT-PRE-COMPILE	
_	Link time X VARIANT-LINK-TIME			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: ECU			

SWS Item	ECUC_SD_00089 :			
Name	SdServerServiceUdpRef			
Description	Reference to SoAdSocketConnectionGroup used for methods. This is used to access the local IP address and port for building the endpoint option for offers of this service.			
Multiplicity	01			
Туре	Reference to [SoAdSocketConnectionGroup]			
ConfigurationClass	Pre-compile time X VARIANT-PRE-COMPILE Link time X VARIANT-LINK-TIME Post-build time X VARIANT-POST-BUILD			
-				
Scope / Dependency	scope: ECU	-	•	

No Included Containers

10.1.23 SdServerCapabilityRecord

Container Name	SdServerCapabilityRecord		
Description	 Sd uses capability records to store arbitrary name/value pairs conveying additional information about the named service. The following use cases are supported: 1) Key present, with no value (e.g. "passreq" password required for this service) 2) Key present, with empty value (e.g. "PlugIns=" server supports plugins, but none are presently installed) 3) Key present, with non-empty value (e.g. "PlugIns=JPEG,MPEG2,MPEG4") 		
Configuration Parame	ters		

SWS Item	ECUC_SD_00033 :			
Name	SdServerCapabilityRecord	dKey		
Description	Defines a CapabilityRecor	d key.		
Multiplicity	1			
Туре	EcucStringParamDef			
Default value				
maxLength				
minLength				
regularExpression				
ConfigurationClass	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_SD_00034 :			
Name	SdServerCapabilityRecordValue			
Description	Defines the correspondi	ng Capab	ilityRecord value.	
Multiplicity	01			
Туре	EcucStringParamDef			
Default value				
maxLength				
minLength				
regularExpression				
ConfigurationClass	Pre-compile time X All Variants			
-	Link time			
	Post-build time			
Scope / Dependency	scope: local	-		

10.2 Published Information

Published information contains data defined by the implementer of the SW module that does not change when the module is adapted (i.e. configured) to the actual HW/SW environment. It thus contains version and manufacturer information.

For details refer to the chapter 10.3 "Published Information" in SWS_BSWGeneral.
